473,325.—FAUCET—S. L. Merrill, Los Angeles, Cal.	
473,343.—VISE—H. C. Rasner, S. F.	
473,348.—REVOLVING FILE AND INDEX—A. J. Rudolph, S. F.	
473,354.—SASH HOLDER—C. Scheibel, S. F.	
473,355.—FOLDING BED—L. Sekofsky, S. F.	
473,032.—BALANCED PISTON—W. J. Thomas, Sausalito, Cal.	
473,033.—SLATE CLEANER—A. Thurber, San Pablo, Cal.	
473,371.—STAMP MILL ATTACHMENT—L. R. Tulloch, Angels, Cal.	
473,037.—SPRAY ROD—W. Wainwright, S. F.	
473,049.—TEETH REGULATOR—D. R. Wilder, Los Angeles, Cal.	
473,279.—DITCHING MACHINE—J. J. Wishard, Sacramento, Cal.	
473,043.—WRENCH—J. A. Zander, S. F.	

The following brief list by telegraph, for April 19 will appear more complete on receipt of mail advices:

San Francisco.—I. A. Bishop and A. F. W. Bell, cable railway switch; Ed. A. H. Booth, stone or ore crusher machine; Joseph Clark, safe ty gas cook; James Davis, pocket cash accountant; Miles B. Dodge, engine; Walter P. Hall, filling physician's prescription; Henry Levy, industrial exp.; Richard S. Shroder, drink mixer; Adolph Schulenberg, concentrator; Francis N. Simmonds, punch; R. W. Whitney, cash register.

California.—Conrad and I. Baker, Santa Ana, truck; Earl B. French, Oakland, feed trough; William G. Ehring, San Diego, chisel, drilling or prospecting machine; George Gilpatrick, Martinez, animal extricator; William T. Gregg, Lakeport, door; Thomas Hardinge, San Jose, machine for filling; Edmund Harrison, Tulare, incubator; Edward K. Jones, Fort Bragg, plant frame; Herbert W. Pudas, Sacramento, machine for cutting screw threads on bolts; Edwin A. Tibbets and C. W. Sadler, Santa Cruz, cigar and ash holder.

Washington.—Peter C. Forester, Wilkeson, mining coal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for American orders). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONTINUOUS REVOLVING FILE AND INDEX.—A. J. Rudolph, San Francisco. No. 473,348. Dated April 19, 1892. This improvement in indexes and files consists of a revolving drum and chain, consisting of inflexible cards or surfaces adapted to be moved over said drum, each card being provided with a means for attaching slips or other matter suitable to be arranged thereon. This invention is of special advantage for library and publishers' catalogues, registers, dictionaries, gazettes, accounts, tables of contents, inventories, records, and, in fact, anything that needs alphabetical, chronological, numerical, classified or other systematic arrangement.

PNEUMATIC CLUTCH.—James Brusie, Oakland. No. 473,330. Dated April 19, 1892. This pneumatic clutch is designed to be used upon rotary machinery in which one portion is to be kept constantly running while the other portion is subject to stops without arresting the motion of the first-named portion. It consists of a pneumatically expandable tube or collar, fitted between the adjacent faces of the two portions of the machinery, and a shoe fitting the exterior of the expandable tube, whereby abrading friction between the tube and the outer portion of the clutch is relieved.

STAMP MILL ATTACHMENT.—Louis R. Tulloch, Angels, Calaveras county. No. 473,371. Dated April 19, 1892. Stamp mills are usually constructed with mortars having five stamps each. During the operation of the stamps it is frequently necessary to raise one or more of them so that they will not be acted upon by the cams, this operation being technically known as "hanging up" the stamps. This invention is designed to accomplish this hanging up of one or more of the stamps, and they may be released and put into operation again in the same manner.

PROPELLER.—John T. Baldwin, Petaluma. No. 473,374. Dated April 19, 1892. This system of endless propeller for vessels consists in an endless belt mounted on end drums at the bow and stern of the vessel, said belt extending and traveling longitudinally of the vessel, under its bottom, and carrying paddles. This propeller is specially adapted for flat or nearly straight bottomed vessels of uniform width of hull. The end drums, over which the propeller passes, are flanged and are housed so as to be practically watertight, and said drums are the full width of the vessel's hull. The endless paddle propeller sweeps the whole bottom of the vessel, and is kept in place by its own buoyancy and by suitable guides. The upper part of the propeller sweeps clear between the two drums

above the upper deck, and by being adjustable as to length its friction on the drums may be regulated to use the whole power of the engine. The inventor, in speaking of the advantages of his plan, says: "Ordinary vessels when running in rivers at good speed, are pushed by their propelling devices against the water, causing the latter to rise several hundred feet ahead of them, to fall nearly a foot abreast of them, and to pile up behind them in large waves, giving motion to a large amount of water constantly. In the ocean the same effect is produced, although it is not so apparent. By the use of this propeller, the water is beaten down in front of the paddles as fast as the vessel comes to it. The paddles take a good grip on the water the whole length and width of the vessel and in the deepest and best place. In practice, at a moderate speed, and in still water, there is no forward or side motion and but little back motion in the wake thus economizing power in a great degree and attaining high speed."

Mining Share Market.

SAN FRANCISCO, April 23, 1892.

Comstock mining shares continued to sell down up to Tuesday morning, when a slight up move set in to Crown Point and Belcher shares. It was reported that the Improved tone was due to a strike in Belcher and to Crown Point extracting ore. As the Belcher strike and that Crown Point would extract ore were known several days before, the advance was probably instigated through cross-orders so as to make a few short sellers fill at a loss, and then, as usual, make quotations and raise the market. The shares possible. It is a regular genuine milking process, and the milker is a master general at the process. The writer still holds to the opinion that the person who holds shares through the present unwarranted depression will have no cause for regret, provided he or she, as the case may be, is content with a fair profit on his or her investment, but is the way in which the mining share market is manipulated that is all wrong. Outside mining shares continue flat, stale and unprofitable.

Outside holders of mining shares are to be congratulated on the dawn of a new era in mining shares, for which they are primarily indebted to the Mining Stock Association, and later to a few leading commission brokers combining so as to avail themselves of a realization of the great wrongs which are perpetrated on the Comstock through the peculiar system of milking ores in vogue in that district. In this they have evidently awakened one set of managers to a realizing sense of the situation, for from personal observation and also from all that can be obtained from disinterested and reliable persons, the writer is thoroughly convinced that J. L. Flood, the young mining magnate, ably assisted by Attorney George R. Wells, is doing all in his power to create the reformations so persistently contended for by the MINING AND SCIENTIFIC PRESS in the interest of outside shareholders. Since the Hale & Norcross mine opened under his control, the mine has been instituted and large sums of money saved to shareholders. While these are very gratifying, yet the crowning event was done last week when Superintendent Rynn gave the railroad car samples of all ores sent to the mill, besides giving the battery or pulp assays of that mill. The pulp assays were within about 81 per cent of the car sample assays. This is about 25 per cent more than was done under the late management. In making public the car sample assays the annex's days have passed. We are credibly informed that the Savage Company will follow in the same line, as will Con. Virginia. It is needless to say that the management of the Gold Hill mines is still defiant; mining looting is too good a thing to give up. Perhaps a suit similar to the one which was brought against the late directors of the Hale & Norcross mine may have to be brought and prosecuted to a finish, to teach the managers that they are not such little gods as they imagine.

The superintendent of the Hale & Norcross mine, in his letter last week, gave the number of tons of ore extracted from each level, and the work done on each level, and the railroad car sample assays of all ore sent to the mill for reduction. This speaks volumes for the new management. The proceeds from the concentrates of the ore milled at the Occidental mill are to go to the mine and not to the mill. Let other superintendents comply with the law and follow the example of Mr. Rynn, then there is some hope for a revival in mining interests along the whole Pacific Coast. The concentrates were formerly worked in the "joker" for the mill ring. The new management of Hale & Norcross propose to turn these concentrates over to the stockholders—or to make it more pointed, all bullion taken from the ore will go to the mines. Speculators will have to take a revival in the price of the stock of the mine, because there will be no mill bullion to be divided.

On last Friday the control of the Savage Mining Co. was handed over to J. L. Flood, who is represented in the Board of Directors by George R. Wells, William Lytle and C. H. Fish. Mr. Wells was elected president. The change was brought about by W. T. Baggett, attorney for the Mining Stock Association. The annual election will take place in July. Reforms of the same kind that have been inaugurated in Hale & Norcross, will be carried out in the Savage.

The same instructions given by the new management of Hale & Norcross, have been sent to the president of Con. Virginia to Supt. Lyman of the latter mine.

The suits of Manuel Eyras against the directors of several mines on the Comstock will come up before Judge Hunt toward the last of next week, or else the fore part of the week following. Mr. Eyras sued each director for the sum of \$1000, in not having superintended the mine properly, and to a few leading commission brokers combining so as to avail themselves of a realization of the great wrongs which are perpetrated on the Comstock through the peculiar system of milking ores in vogue in that district. In this they have evidently awakened one set of managers to a realizing sense of the situation, for from personal observation and also from all that can be obtained from disinterested and reliable persons, the writer is thoroughly convinced that J. L. Flood, the young mining magnate, ably assisted by Attorney George R. Wells, is doing all in his power to create the reformations so persistently contended for by the MINING AND SCIENTIFIC PRESS in the interest of outside shareholders. Since the Hale & Norcross mine opened under his control, the mine has been instituted and large sums of money saved to shareholders. While these are very gratifying, yet the crowning event was done last week when Superintendent Rynn gave the railroad car samples of all ores sent to the mill, besides giving the battery or pulp assays of that mill. The pulp assays were within about 81 per cent of the car sample assays. This is about 25 per cent more than was done under the late management. In making public the car sample assays the annex's days have passed. We are credibly informed that the Savage Company will follow in the same line, as will Con. Virginia. It is needless to say that the management of the Gold Hill mines is still defiant; mining looting is too good a thing to give up. Perhaps a suit similar to the one which was brought against the late directors of the Hale & Norcross mine may have to be brought and prosecuted to a finish, to teach the managers that they are not such little gods as they imagine.

News from the Bodie district reports the ore in the waste dump below the 700-foot level, even though it is claimed that it is very rich. It is claimed that it will run into Bodie. The mill is to be enlarged from a capacity of 10 tons daily to 25 tons daily. It is still running on Mono ore. The pulp assays for the week were over \$38 a ton. The prospects in Bulwer, Summit and Bodie could not be better. No change is reported in the Quibota or Tuba mines. The change in the Comstock district the news is uniformly of the very best character, much of which is not even touched on in official letters. It is said that on the 1800-foot Ward shaft level, arrangements have been made to run inter drifts north and south from the end of the cross-drift, so as to develop later on, by east and west cross-drifts, Alpha, Exchange, Bulwer and Potosi at that depth. While this is being done, work on the upper levels will be discontinued. A rich strike is reported in two of the Gold Hill mines. Developing work in Con. Virginia, on the 1900 level, is to be commenced soon.

A Smokeless Locomotive.

Extracting Metals by Electricity.

Dynamical Theory of Earthquakes.

Magnetic Iron Rust.

TWO NEW AERONAUTIC INVENTIONS.—A German aeronaut, Herr Heinrich Lattermann, says *Iron*, has devised two aerial machines which are attracting much notice on the Continent. The first is a new kind of parachute, which, it is stated, is but half the size of any hitherto used, and can be rolled up like a cloak. When the hazardous leap is made, the parachute instantly unfolds and expands. This form of parachute is considered to be of great importance in view of its lightness, permitting several of the apparatus to be carried and used in case of emergency by as many persons. It is added that the parachute can be employed in any weather without danger of entanglement in the network of the balloon. A further advantage is claimed in that the rapidity with which the parachute opens renders it possible to the aeronaut to descend almost on the spot whence he embarked, as precipitation from the balloon may take place from a comparatively insignificant height, before the balloon has begun to make much lateral headway. The second invention is a gigantic parachute balloon, the distinguishing feature of which is the attachment of a balloon of a capacity of about two cubic meters being converted into a parachute. The balloon is of spherical shape, and is so constructed that the under portion may at any decided moment be turned to collapse with the aid of a valve. When the balloon assumes its normal shape, the parachute of more than 100 square feet is in readiness for use.

ment of the balloon is, as a precaution, prepared with asbestos and other fireproof materials. Heated air for filling the bag is to be supplied by a furnace of Hatteman's own make. The first ascent with these new apparatus will shortly be made in Berlin. In August the inventor purposes proceeding to Chicago, with the object of making arrangements for a series of aerostatic exhibitions during the forthcoming exhibition in that city.

TEMPERATURE OF MELTING STEEL.—In a communication to the Paris Academie des Sciences, M. Le Chatelier states that by means of his pyrometer he has discovered that the temperatures which occur in melting steel and in other industrial operations have been overestimated. These exaggerations, we learn from *Engineering*, the author attributes to several causes. When estimates of temperature disagree, there is a natural tendency to adopt the highest, because there is an instinctive desire to establish some sort of proportionality between the light emitted from a heated body, the amount of fuel required and the temperature. But the fact is that both the amount of light emitted from a body and the quantity of fuel required to heat it, increase much more rapidly than the temperature. Moreover, the calorimetric method has been that most frequently adopted for determining high temperatures. In this the assumption is made that the specific heat of the iron rods or balls used is constant, which is inaccurate. In the case of the flame of the Bessemer converter, Mr. Langley has fixed the temperature of the issuing flame at 2000° C., because platinum appears to melt rapidly in it. Mr. Chatelier has, however, found that platinum does not fuse in the flame, but only appears to do so because it alloys itself with drops of molten steel carried over by the blast.

ELECTRICITY.

Peculiar Behavior of Oil as an Insulator.

Now that oil is universally recognized as a good insulator, and that its use is not patentable, says the *Electrical World*, reports its shortcomings are beginning to appear of which seem to show that, although very good under certain conditions, it has certain peculiar qualities which warn us to proceed slowly with the use of it until we know more about its idiosyncrasies. Prof. Elihu Thomson, who has experimented perhaps more than any one else in this field, noticed during the course of his experiments some curious anomalies which at first could not be understood. He found, for instance, that with very moderate potentials, puncture through the oil would occur in some cases through considerable distances, while in other cases the insulation was maintained. His experiments, which are not yet completed, seem to indicate that low periodicities of 125 or thereabouts, and comparatively smooth waves of current, such as are given out by the ordinary alternating current apparatus, will cause puncture over much longer distances under oil than occur with very high period current discharges. In fact, in some of the experiments the striking distances in oil have been approximately like those in air, falling not much below. With potentials from a high period machine giving from 3000 to 5000 alternations per second, the insulating quality of the oil seemed to be much better, and his experiments show that with high periods and very high voltages the insulating qualities of oil are all that could be desired. One of the most curious effects which he noticed in the course of his researches was that it takes time to break down oil; that momentary contacts are by no means sufficient to cause puncture, but that if the alternating waves are kept on for periods varying from a few seconds to half a minute or more, the oil will break down at last; and, furthermore, that the wider the distance between the electrodes the longer the time it seems to take to break it down. It is suggested that there may exist in the oil conducting particles which arrange themselves very much as iron filings do in a magnetic field; also that there may be some sort of convection which carries electrified oil from the electrodes into the space between them, finally breaking down the oil. He is at present continuing to investigate the subject more fully, and with his well-known perseverance we have no doubt he will soon get at definite and reliable results. In order to see whether the same element can be extended, he intends to keep the oil flowing under pressure between the electrodes. To show how curious some of the results are, he found that under certain circumstances, potentials which perforated oil at a distance of three-eighths of an

inch, at other times failed to puncture the same oil at a thirty-second of an inch. Such results certainly show that it is very necessary to investigate the subject more fully before relying too much on the small amount of knowledge we have up to the present time, regarding the insulating properties of oil. The law of resistance, which is such a simple one for continuous currents, appears to be a very complicated one when it concerns alternating currents, and especially so, apparently, when these alternating currents are of high frequency and exceedingly high potential. It would be a very valuable contribution to our knowledge of the subject of the insulating properties of oil if those who have the facilities will endeavor to discover its law—if there is any—before we make any mistakes by relying on our present insufficient knowledge of the subject.

An Era in Local Telephone Industry.

California will presently have as perfect a telephone system as any section of the Union. It will be possible for a resident of Ukiah to talk with a friend in San Diego without going farther than the nearest telephone stand, and it won't be as wearisome to do so as it sometimes is now to talk with your butcher in the next block.

The Sunset Company is making these improvements. Recently there arrived at the Oakland mole a monstrous cable, which will connect San Francisco and Oakland. It came over from New York in a car specially built for its carriage, for its 70,000 pounds would have been too much for the ordinary flatcar.

This great rope is said to be the very acme of perfection in the line of submarine cables. It is composed of 30 wires so incased in nonconducting materials that the loss of power will be almost nil. Each of the 30 consists of three minute lines of copper wound around one another; these are incased in rubber, and around the rubber is a tape; around the 30 which make up the core of the rope is wound more tape, and outside of this is a heavy thickness of a patent preparation called *okonite*; finally, surrounding and protecting all, is an armor of galvanized iron wires.

This section, weighing 70,000 pounds, will be stretched from the wharf to Goat island; across the island the current will be carried by 40 heavy copper land wires, and from the other side a similar cable will carry the messages to Oakland. Hitherto, communication with interior points has been over a ten-wire cable and ordinary iron lines. The cable has been supplanted, and so presently will be the iron lines.

The company has already established between San Francisco, Stockton and Sacramento an improved metallic circuit service, making it possible to hear at one place a whisper spoken at the other. Copper wires are being stretched to all interior points, and in a few months one end of the State will be in communication with the other. The company has contracted for 10,000 poles and 4000 miles of copper wire, and the lines are being strung along as rapidly as possible. Five hundred thousand dollars will be spent in this work this year.

Applying the Motors.

Mechanical and electrical engineers who have, during the last few years, had more or less discussion on the advisability of having motors on each axle or at the head of trains where electricity is used to supplant steam motive power on light railways, will soon have an opportunity of judging of the wisdom of the positions they each have taken. The City and South London Railway, to which reference has frequently been made, is run by motors at the head of each train, this arrangement being adopted after a full consideration of the merits of the two plans, because of the fact that it made fewer motors to take care of, and that in underground work it would be especially objectionable to have a series of motors removed from the immediate inspection of the driver and practically inaccessible in case of accidents of any kind. On the other hand, the Liverpool Elevated Railway, which is in process of construction, is also going to be run by electricity, but the motors are to be applied to each car. This arrangement of motors was also adopted only after careful consideration, and in this case was one of necessity rather than one of choice, as the exigencies of construction necessitated a light elevated structure and a heavy locomotive at the head of each train would prove very undesirable, and for that reason it has been decided to use individual motors with a full realization of the greater amount of machinery which must thus be taken care of, the objection being in a measure mitigated

by the fact that the nature of the line makes the motors readily accessible and serious trouble from this cause less probable. It will therefore be seen that the narrow limits of a tunnel and the inaccessibility of motors have in one case led to the adoption of a single motor at the head of the train, and that the lightness of the structure has in the other case necessitated the employment of motors in each car. When these two lines have been in operation for a long enough time to get some tangible results from the performances of the motors, electricians and mechanical engineers will then have a chance to settle definitely this question of the arrangement of electrical motors for railroad work.—*Railway Review*.

IN connection with the recent experiments in high potential discharges of great frequency, made by Tesla and Thomson, and the long-distance power transmission tests in Germany, it is interesting to note that the use of oil as an insulator, whose value was so well proved for use in these different connections, is authoritatively stated not to be patentable, and the use of this insulating material is, therefore, free to everybody.

AN electric tuning box for the use of leaders of orchestras and others interested in music has been invented by a Frenchman. It consists of a dry-pile battery connected with an electric magnet. When placed on a sounding board, the required note is obtained by moving a small commutator located in the box.

A RECENTLY DESIGNED incandescent electric lamp, supported by springs, is intended for use in carriages and other vehicles. Current is to be supplied from a storage battery carried under the seat or in any convenient place.

USEFUL INFORMATION.

A Curious Air Barometer.

The following is a novel illustration of an air barometer—a phenomenon connected with an automatic ink well, says the *Optician*. The well consists of a glass vessel having in the top two apertures—one containing a funnel-shaped fountain dipping into the ink and the other holding a screw, the end of which presses on a rubber disc. The principle of the ink well is simple. It will be noticed that there is no connection between the atmosphere on the outside and the air imprisoned in the vessel; also, that as the screw is moved up or down, the space not occupied by the ink increases or decreases. When, therefore, it is desired to have the ink rise in the fountain, the screw is turned down so as to press down the rubber disc. It will readily be seen that as the space is thus decreased, the inclosed air becomes compressed; but, by the force of its elasticity, it presses upon the ink and forces it into the fountain. When the screw is turned up again, the capacity is increased, the tension of the air inside is lessened, and the ink in the well falls. In this simple way, a writer, by turning the screw one way or the other, can cause the ink to fill the fountain brimful, or to recede to its black depths. However—and this brings us to our curious air barometer—it was noticed that the ink in the fountain would rise and fall, although the screw remained unmoved, and would thus continue to fluctuate at regular intervals. At first the cause seemed to be the changing temperature of the room, which, of course, would affect it. The expansion of the inclosed air, due to the rise of temperature, would cause the ink to rise, while a contraction of the air from a lower temperature would be followed by a corresponding sinking of the fluid. But the fountain would be filled sometimes at a low temperature, when we should have expected it to be nearly empty. Obviously, the cause was the varying pressure of the external atmosphere. At a low barometric pressure, the tension of the inside air being greater than the atmospheric pressure, would cause the ink to rise in the fountain. At rising barometer, on the other hand, the excess pressure would be from without in, and a consequent falling of the liquid column would ensue. In short, the ink well was a modified air barometer, and would have served not only its principal purpose, but, if it had been carefully protected from the variations of temperature, would excellently have filled the office of an air barometer.

UTILIZING SMOKE DUST.—An important German mining and metallurgical concern, the Georgs-Marien Verein, which possesses several blast furnaces, utilizes the dust deposited by the smoke of the furnaces, mixing

it with pyrites debris, in order to recover the iron contained in the gases. The process consists in blending this residuum with the pyrites debris, the mixture then being formed into briquettes for roasting. The presence of the dust, disengaged from the blast furnace throats, considerably augments the cohesion of the briquettes.

GOOD HEALTH.

CHRONIC ARSENICAL POISONING.—A good example of chronic arsenical poisoning on a large scale occurred in County Asylum, Berrywood, and a short account of it may be both interesting and instructive. In the endeavor to make the wards of an asylum bright and cheerful, and to do this at as little expense as possible, it is not improbable that the nature of the coloring materials used may be overlooked, and that some of the gastric and intestinal disorders which disturb the peace of mind of medical superintendents may be cases of arsenical poisoning. For a long period the nurses here were in poor health. First one and then another was laid down until, within a few months, nearly every nurse on the staff had been, or was, under medical treatment. Headache, neuralgias, gastric derangements, loss of appetite, constipation or diarrhoea, irritation of eyelids, anæmia—these were the chief symptoms complained of. Drugs did not appear of much avail, but a holiday had a marked effect for good. At last one nurse had the eye symptoms in a more pronounced form, and suspicion was aroused. In each nurse's room was a green baize curtain, used as a covering for dresses, etc. A portion was taken and examined. It was found to be impregnated with arsenic to an astonishing extent. These curtains were removed; the rooms freely ventilated; medical treatment was stopped; the symptoms disappeared, and, though some months have elapsed, have not returned. The baize was similar to that used for covering doors, etc., and was obtained from two manufacturers.—W. Harding, M. B., in the *Lancet*.

SOPORIFIC PROPERTIES OF LETTUCE.—Although preparations of lettuce have from very early times had a reputation in medicine for their soporific properties, the narcotic constituent of the plant has never been ascertained with any certainty. Various neutral, fatty, and waxy bodies separated from the milky sap of different species of *Lactuca* have been from time to time described as compounds of medicinal value, but on the other hand it has been denied that the dried milk sap, *lactucarium*, in spite of its narcotic odor, possesses any sedative action, and in fact, this preparation is no longer official in England or the United States. It is, therefore, interesting to learn in a communication from the Research Laboratory of the Pharmaceutical Society, read recently before the Clinical Society, that Mr. T. S. Dymond has established beyond doubt the presence of hyoscyamine, the principal alkaloid of belladonna and henbane, not only in the cabbage and *Cos* varieties of the common lettuce, *L. sativa*, but also in the wild lettuce, *L. virosa*. The amount in the young plants is certainly very minute, but in the official green extract, which, according to the directions of the "British Pharmacopœia," is to be prepared from the flowering herb of *L. virosa*, the mydriatic alkaloid occurs to the extent of 0.02 per cent.

THE BEST MOSQUITO REMEDY.—Mr. C. H. Russel, of Bridgeport, Conn., has recently communicated to us the following interesting fact: A very high tide recently broke away the dike and flooded the salt meadows of Stratford, Conn. The receding tide left two lakes, nearly side by side, of the same size. In one lake the tide left a dozen or more small fishes, while the other one was fishless. A recent examination showed that while the fishless lake contained tens of thousands of mosquito larvae, that containing the fishes had in it no larvae. An English gentleman living on the Riviera, according to a correspondent of *Nature*, having been troubled by mosquitoes, discovered that they bred in the large tanks kept for the purpose of storing fresh water, which is rather a rare commodity at this Mediterranean resort. He put a pair of carp in each tank and succeeded in this way in extirpating the insect pest. The utilization of fish in this way is an old suggestion, and a very practical one under some circumstances. Many people suffer from the mosquito plague when the insect breeds in a circumscribed and easily accessible place, and where it could be destroyed by some such method as that used by the level-headed Englishman.—*Insect Life*.

SATURDAY, APRIL 30, 1892.

TABLE OF CONTENTS.

ILLUSTRATIONS.—The Oates Combination Crusher and Pulverizer for Ores, 315. Ground Plan of Breaker for Sorting, Sizing and Cleaning Coal, 323.
 EDITORIALS.—The Oates Combination Crusher and Pulverizer; A New Mill for Mexico; Treatment of Tailings, 315. Better Information for Stockholders; Silver Clubs and Leagues; Saving Float Gold, 322; Plan of Coal Breaker, The Comet, 323.
 CORRESPONDENCE.—Lixivation of Gold Ores; The Prospector and the Sheepman, 316.
 MECHANICAL PROGRESS.—A Smokeless Locomotive; Extracting Metals by Electricity; Contact of Plates; Reinvention; The Largest Turbine; Color in Tempering Iron, 420.
 SCIENTIFIC PROGRESS.—Dynamical Theory of Earthquakes; Magnetic Iron Rust; Application of Psychological Research to Anthropology; Two New Aeronautic Inventions; Temperature of Melting Steel, 320.
 ELECTRICITY.—Peculiar Behavior of Oil as an Insulator; An Era in Local Telephone Industry; Applying the Motors; Miscellaneous, 321.
 USEFUL INFORMATION.—A Curious Air Barometer; Lixivating Smoke Dust, 321.
 GOOD HEALTH.—Chronic Arsenical Poisoning; Soporific Properties of Lettuce; The Best Mosquito Remedy, 321.
 MISCELLANEOUS.—Mock Gold; American Society of Mechanical Engineers, 316. Mexican Mines; Evolution of Inventions; To Supplant Stamps; Granite Rocks; The Precious Metals; Putting Inventions on the Market, 317.
 MINING SUMMARY.—From the Various Counties of California, Nevada, and other Pacific States and Territories, 318-319.

The Comet.

The comet discovered by Swift of Rochester on March 7th (comet b, 1892), is so bright that the head and nucleus may be seen by the naked eye in bright moonlight, while the tail may be seen now on any clear morning.

Those having star maps may easily find it by inspecting the following places on the dates given below:

Date.	R. A.	Dec. North.
May 1.....	22h. 32m.	20° 54'
May 2.....	22h. 33m.	21° 18'
May 3.....	22h. 33m.	22° 00'
May 4.....	22h. 41m.	22° 41'
May 5.....	22h. 44m.	23° 22'
May 6.....	22h. 47m.	24° 03'

Those without star maps may find the comet in the following manner: Observe the exact position of the sun on April 30th at 7 A. M. On May 1st at 3 A. M. the comet will be found in exactly the same place, excepting that it will be just ten times the diameter of the sun north of the position the sun occupied on the 30th at 7 A. M.

On the 4th the comet will at 3 A. M. be just thirteen diameters of the sun north of the place occupied by the sun on the 3d at 7 A. M.

The observer may work out the position for the other and intermediate dates himself—it will be good practice for him. A good opera glass is all that is needed for a good view on these dates. This comet is the brightest one discovered since the grand one of 1852, and will be visible for perhaps more than a month, but, as it is now receding, between now and the next moon will be the best time to observe it.

After the above dates the moon will seri-

ously interfere with the fainter parts and powerful telescopes only will give satisfactory views.

Silver Clubs and Leagues.

The work of organizing "Silver Clubs" in Colorado, Nevada and other silver States continues to be energetically carried on. In the two States mentioned State Silver Leagues have been organized. The plan is now to desert the old political parties, as parties, and vote for no man for President unless he shall be unreservedly in favor of the free coinage of silver. One of the resolutions of the Denver Silver Club contains the pith of the new movement and is as follows: "We believe the time is now come when every voter in the Nation should rise to the dignity of an American citizen and make haste to assert his independence of any political party, unless that party shall protect his rights from the merciless grasp of the money power."

The new movement started only a little over a month ago in Denver, Col. The work began by an organization of silver clubs throughout the mining camps and larger towns. It soon became apparent that the sentiment expressed by the resolutions adopted by these various clubs was the sentiment of a large mass of voters throughout the country, and that a State organization was both feasible and desirable. When some 40 clubs had been organized, a conference of the presidents of these clubs was called, and held in Denver on the 26th ult. More than 30 of the clubs were represented at that meeting, and a State organization was perfected, which is now in working order.

Regarding the growth of the movement, it may be said that there are now nearly 70 clubs in active operation in different parts of Colorado (mostly, however, in the mountains), with an aggregate membership of something upward of 25,000. The number will be definitely known within a few days, when the committee shall come to apportion delegates to the State Silver Convention. The Denver club alone now numbers over 10,000 voters.

The resolution quoted above is the pledge that serves to bind the members together as a distinct organization, and it is this feature which sends consternation to the heart of the petty politician. In the beginning they sneered at it, and expressed doubts as to its carrying weight. These doubts, however, are rapidly disappearing, and their place is being filled by fears of what may be accomplished. Certainly, as far as Colorado is concerned, the outlook is promising in the extreme, the movement is popular beyond precedent, and the members there are anxious to see it extend, at least, throughout the silver-producing States and Territories.

It is hoped that this growth will be sufficiently rapid to place the friends of silver in these States on a working basis, to the end that their influence, in common with the Colorado men, may be felt at the Minneapolis Convention. The force of the entire West, at that Convention, should be ready to act as a unit on all questions touching Western interests, especially the silver questions and the presidential candidate. In Nevada this movement has made a good start, and a State Silver League is engaged in enrolling voters irrespective of party.

COST OF CYANIDE.—Mr. A. B. Paul, Jr. writes us that Mr. Merrill has made a mistake in figuring the cost per ton of the cyanide, in his article of last week. He states it would cost \$7.50 per ton for the salt as per his experiments. In actual work Mr. Paul said they "find the loss to be about two pounds per ton. The process calls for C. P. cyanide and that grade can be furnished for, o. b., New York at 50 cents per pound. It is guaranteed at not less than 98 per cent. Hence the cost for cyanide of the required grade per ton is but one dollar."

Saving Float Gold.

In the recovery of precious metals from their ores it is well known that the crushing and grinding process to which the ore is subjected produces a fine, impalpable slime, which carries a great deal of fine gold and mercury which have been triturated by the preceding operation to such an extent that they will float upon the surface of the water and are very difficult to bring into contact with any amalgamated plates or surfaces over which the material passes.

W. E. Darrow of Amador, Amador Co., has just patented through the MINING AND SCIENTIFIC PRESS PATENT AGENCY an appliance which is designed to bring these slimes into intimate and forcible contact with amalgamating surfaces without subjecting them to the cutting action of the coarser sands which are carried along with them. It consists of corrugated amalgamated plates situated one above the other, with the corrugations extending longitudinally and the corrugations of one projecting into the spaces of the other. One of these plates is stationary and the other has a shaking movement.

The operation is as follows: The amalgamator is placed in front of the battery, though the pulp is first allowed to flow over an ordinary amalgamating plate. The pulp then flows over the amalgam trap at the upper end of the apparatus and thence upon the shaking table or lower plate. The shaking motion causes the pulp to be splashed from side to side, the surface being dashed against the amalgamated corrugations of both the upper and lower plates so that any fine valuable material carried in the slime will be brought into forcible contact with these amalgamated surfaces. The operation is such that the slimes are subjected to violent motion which will repeatedly and constantly throw them into intimate contact with the amalgamated surfaces so that the valuable precious metals will be retained thereon while the heavier material will flow along in the depressions between the ridges. Any small particles are caught in the amalgam trap at the lower end.

The lower sluice is movable and the ridges or corrugations extend from one end to the other. The sides are higher than the ridges, so the material will not splash over. The sluice is supported upon elastic arms or springs, and these may be raised or lowered to keep the sluice level transversely and adjust it. At the upper and lower ends are traps or semi-cylindrical troughs. These are copper-lined and serve to collect any particles of amalgam or precious metal which are heavy enough to drop into them. This table or sluice is given a side-shaking motion by means of suitable rods and cranks.

A second amalgamated plate is supported above the lower one and has corresponding corrugations projecting downwardly between those in the lower plate. This stationary table or plate is adjustable with relation to the lower or shaking table so as to maintain a proper distance to allow the coarse material to flow freely, and at the same time produce the desired action upon the slimes.

The two plates are near enough together to allow the coarse sands to flow along the bottom of the shaking table without being interrupted by the corrugations or projection of the upper one; but they overlap each other sufficiently so that all the slimes and lighter material which pass down the sluice will be violently forced against these corrugations as the table moves from side to side.

AN ELECTRIC SAWMILL.—An installation of wood-working machinery for Lord Rothschild has just been erected at Tring Park. The plant comprises bandsaw and circular saw machines for converting logs, deals, etc., as also planing, molding, mortising and tenoning machines, the whole of which are driven by electric motive force. The machinery has been supplied by Messrs. A. Ransome & Co., of Chelsea, and

erected under the superintendence of the resident engineer, Mr. C. Burman Callow. Although isolated machines have been driven by electricity, we believe this to be the first complete sawmill worked under these conditions.

Better Information for Stockholders.

The recent Hale & Norcross suit has had a good effect on Comstock mine management in several ways. This week, for instance, for the first time, the Hale & Norcross report properly conforms to the law by giving the battery assays and car sample assays, the amount of ore raised from each level, etc. Generally the more valuable information was reserved for the directors, or "insiders," while the stockholders had what amounted to nothing. It is understood that the Savage and Cons. California and Virginia mines will soon follow suit with more complete detailed weekly reports.

Under the new management of the Hale & Norcross, the percentages of value show up higher. The developments in the recent suit showed there was quite a difference in percentages of the battery assays given the public and the car sample assays given the directors.

There are several suits pending in which various directors in several companies are asked for \$1000 damages each for keeping back information the law says they should make public. If these suits are decided against these directors, one of them at least will have to hand over some \$10,000 and others smaller sums. The suits were commenced by Manuel Eyre, who was a stockholder in the respective mining companies.

This system by which the stockholders paid the bills and the insiders got the profits has been going on so long that many of these directors look upon it as a piece of effrontery for the stockholders to object. It was only persistency and determination on the part of a few men that started the crack in the system which will eventually break it up altogether. The directors will all be more careful to obey the laws in the future, whether they want to or not; for when men are liable in damages, and are watched, they are apt to be more honest than when they have everything their own way.

ELECTRICITY AND HOISTING MACHINERY.—At a meeting of the Royal Scottish Society of Arts, Edinburgh, Mr. John Ritchie, engineer, read a paper on the "Application of Electricity to Hoisting Machinery." The purpose of his paper, he said, was to show the advantage of electricity over the direct use of steam and other methods of transmitting power to cranes. The modern electromotor was a highly-efficient machine, and in transmitting power its efficiency rose as high as ninety per cent. In small installations, in which the dynamos were driven direct by steam engines, eighty per cent. of the useful effects of the steam engine was given out by the dynamo, and with a large and economical engine driving machinery in a workshop where the power expended on the dynamo would only be a fraction of the whole, the useful effect would be still greater—say eighty-five per cent.

The loss in transmission would not exceed two per cent. An ordinary steam crane did not show such an economical result. Dealing with the application of motors to derrick cranes, Mr. Ritchie said there were certain drawbacks to the use of the steam derrick which were in great measure connected with the boiler.

GIFT OF A FINE TELESCOPE.—S. H. Barrows of Claremont, in Pomona valley, and some unknown lady of large means in Ventura county, have presented the Pomona Congregational College with the largest and finest telescope in Southern California. The instrument cost \$8000 in Boston, and will cost \$1000 more to set up and make it ready for astronomical observations.

Plan of Coal Breaker.

In recent numbers of the PRESS several illustrations have been given showing the methods of handling and sorting coal at the iron-breaker at Drifton. On this page is a ground plan of the breaker, showing the relative position of the pockets, lump-coal chute, the drags, mouths of pockets and loading tracks. Outside of the line of pockets there is an addition supported on one side by four cast-iron posts and on the other

pocket; P5, chestnut coal pocket; P6, pea coal pocket; P7, P8, P9, coal pockets for different sizes of chestnut coal; Q is the loading lip for the lump coal chute; Q2, for broken coal pocket; Q3, for egg coal pocket; Q4, for stove coal pocket; Q5, loading lip for chestnut coal; Q6, ditto for pea coal; Q7, Q8, Q9, for different sizes buckwheat; T is the lump coal loading track, and outside of that is the steamboat loading track; T2 is another outside loading track; T3, inside loading track; T4, reloading mine car

An English View of Our Tin Prospects.

While the prosperity of the metallurgical trades in America must necessarily have its reflex on this side of the Atlantic, the very reverse is the case with the important tinplate industry which manufacturers in the United States are bent upon establishing. It is evident that, if they succeed in supplying their own wants in tinplates, the depression which will fall upon the industry in South Wales will involve, in no small measure, one

they were justified in this attitude is clearly shown by the employment of Welch tinnmen, whom they soon found were alone capable, by their experience, of elevating the manufacture of tinplates to a "national" industry. It is creditably asserted that during the past year not one sheet of coke tins was put upon the market by American producers; and coke tins constitute more than one-half the entire requirements of the United States. The outturn of the American tinplate works was about one per cent of the whole consumption. This is not very encouraging, in view of the considerable efforts and expenditure of money which have been made

GROUND PLAN OF BREAKER FOR SORTING, SIZING AND CLEANING COAL.

by the western posts of the pockets, in which addition are arranged the twelve jigs, as shown in the accompanying general plan. The height of the breaker from the railroad track to the peak of the roof is 91½ feet; to the dump, 79 feet. The greatest amount of coal passed through and cleaned in the breaker is a little over 260 tons per hour.

In the plan J are the stove jigs; J1, chestnut jigs; J2, flat chestnut jig; J3, pea jigs; J4 and J5, buckwheat jigs; K4 is the gyrating, flat chestnut separator; G2, for steamboat coal; G3 is for the broken (slate coal); G4, egg; G5, stove; G6, chestnut; G7, flat chestnut rolls; M is the slate drag (jigs); M1, supplementary coal drag (from loading lips under pockets); M2, main coal drag; M3, dust drag (settling tank); N, slate conveyor; P is the lump coal chute; P1, steamboat chute; P2, broken coal pocket, P3, egg coal pocket; P4, stove coal

track; V is the slate drag engine; Z, settling tank.

Gold Ores of Shasta County.

SAN FRANCISCO, April 25, 1892.

TO THE EDITOR:—Your correspondent, "Boston," in his letter last week on the above subject, makes a mistake; also answers his own questions. The gold does not dissolve, but remains suspended in water; the fact that it can be recovered by settling, filtering, etc., proves this; also proves that the loss is mechanical and avoidable by a better system.

The MacArthur-Forrest process, intelligently applied, either to the slimes alone or to the entire ore, is a remedy for just such a case.

C. H. AARON.

THE people up around Puget Sound protested against United States war vessels coaling at the British ports, when domestic coal can be procured at Seattle; and the Acting Secretary of the Navy has issued an order that all naval vessels cruising in Puget sound shall get coal at the Sound ports.

branch, at least, of the mining interest. Fortunately, for the South Wales producers at least, the experiments that have been made in the United States during the past year have not been attended with success. It is found, it would seem, that the tinplate industry refuses to take root in any soil, however carefully it may have been prepared. A shrub from Cuba planted in the snows of Labrador could not have failed more completely than the tinplate industry taken from South Wales to America has so far done. It has been protected in every possible way, and sheltered from the withering blast of competition by the help of prohibitive duties; but, in spite of all this care, the tinplate industry is sickening nigh unto death. Failure was in the first place due to the determination of manufacturers to dispense with foreign labor. The industry was to be of purely national growth. How far

to put the industry upon a satisfactory basis. Nor is there much promise contained in the statement that the small outturn of tinplates in the United States could not be sold for the prices which the Welch makers, in spite of the high tariffs, were able to accept. It is not likely, however, that the American producers will give up in despair without making further serious efforts. They are trying to produce cheaply by making their plates thinner and lighter, and with a further view to economy, they are purchasing a number of Welsh patent tin pots, besides importing cold rolled pickled and annealed steel, of Nos. 29 and 30 gauges, cut to sizes ready for tinning. Tinplates produced under these conditions by Welsh workmen can hardly be called an American product, and it is exceedingly doubtful if they would allow of any considerable margin of profit to the manufacturer. What, however, is indisputable is the fact that the South Wales industry, with its low cost of production, is not likely to be permanently restricted by the competition of tin plates produced in America.—London Mining Journal.

A New and Valuable American book for Prospectors and Miners.
JUST READY.

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining," illustrated by 44 engravings. 12mo, 176 pages. Price \$1.50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores, Wet Method, Dry Assay of Ores. V. Special Mineralogy, Gold. VI. Platinum, etc., Silver. VII. Copper, and How Measured by Gies. VIII. Lead and Tin. IX. Zinc, Iron. X. Mercury. Blismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Printers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. 8vo. 387 pages. Price \$4.50, by mail, free of postage to any address in the world.

Descriptive circulars giving the full tables of contents of the above books sent free to any one who will send his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

NEW AND VALUABLE BOOKS

—FOR—

METAL WORKERS.

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Co-tact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brant, Editor of "The Techno-Chemical Receipt Book." Illustrated by 135 engravings. In one volume, 8vo, 404 pages. Price \$4.00.

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry; Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo, 296 pages. Price \$2.50.

BRANNT.—The Metal Worker's Handy Book of Receipts and Processes.—Being a Collection of Chemical Formulas and Practical Manipulations for the Working of all the Metals and Alloys, including the Decoration and Beautifying of articles manufactured therefrom, as well as their preservation. Edited from various sources by William T. Brant, editor of "The Techno-Chemical Receipt Book." Illustrated by 63 engravings. Over 500 pages, 12mo, cloth, gilt, closely printed, containing a vast amount of valuable matter on all the Metals and Alloys, not to be found in any other book in the English language. Price \$2.50.

BRANNT.—The Metallic Alloys. A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and Solders used by Metal Workers, together with their Chemical and Physical Properties, and their application in the Arts and Industries; with an Appendix on the Coloring of Alloys. Translated and edited, chiefly from the German of A. Krupp and Andreas Wildberger, with extensive additions, by William T. Brant, one of the editors of "The Techno-Chemical Receipt Book," etc. Illustrated by 16 engravings. 12mo, 428 pages. Price \$3.00.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

Circulars, giving the full Tables of Contents of all of the above books, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, April 28, 1892.

While there is more or less croaking in certain branches of trade, yet there are unmistakable evidences that the volume of goods going out on orders, is larger than at this time in 1891. While trade is undoubtedly larger yet the profit is smaller owing to strong competition. Among iron workers there is generally an air of satisfaction. More orders are, as a rule, on hand, than at any one time for several years past. They are not so fearful of entering into contracts now, as they were for the past three years, owing to their not having fears of labor troubles before the work is finished. Cheap raw material is in their favor.

In the local money market a plethora of funds is reported. There is no marked call for money for speculative purposes or from any particular branch of trade. Eastern mail advices report money in over supply. The same condition obtains in the money markets abroad. To the unsettled condition of silver, it is now being acknowledged is largely due the general stagnation in all branches of trade and speculation throughout the civilized world.

QUICKSILVER—Receipts the past week aggregate 530 flasks and the exports 125 flasks sent to Mexico. The market is weak at \$12 per flask, with a rebate of \$7 for export.

MEXICAN DOLLARS—The market is dull and heavy at a round 69 3/4 cts.

SILVER—The market shows more strength notwithstanding a strong bear pressure abroad. The government has been longer in securing 4,000,000 ounces in this month than in any one month since the law went into effect. The extreme silence regarding the silver question at Washington taken in connection with silver buyers being organized in nearly all the States on this coast, is being accepted as evidence that himetalists are on a still hunt at Washington, looking to securing more favorable action in favor of free coinage. In Europe the silver question continues to attract attention. To the low and fluctuating price of silver is attributed many of the evils now afflicting trade in all parts of the world. It lessens the purchasing power of many nations, while it gives to moneyed men in gold standard nations the power to form combinations calculated to disorganize all branches of business and makes every thing operated in partake more of a speculative than of a legitimate character. The output of silver, it is said, is decreasing the world over owing to the low prices not admitting of profit to mine owners.

LIME—Receipts the past week aggregate 451 barrels. The market continues in buyers' favor.

BORAX—Receipts the past week aggregate 215 cents and exports by sea to New York 303 cents. The shipments overland to distribution centers at the East during the month drawing to a close will show a decided increase over the shipments during preceding months.

ANTIMONY—The market is fairly easy at quotations. Current quotations at New York are as follows: 10 1/2 cts for Hallet's, 12 1/2 cts for L. and 14 1/2 cts for Cookson's, and 13c for "Crown" brand.

LEAD—Corroders and other consumers of pig on this coast report an increased consumption. At the East the market is reported fairly firm, with a large consumption by corroders. Dealers do not look for any further improvement in prices.

TIN—Imports the past week aggregate 88,405 boxes of plate. The demand for plate is light. It is claimed that the consumption will show a decided falling off. In pig a corner is being run. English cables report a slow market for plate, with values settling to lower figures.

PIG IRON—The market is barely steady. It is claimed that concessions are obtainable on late asking prices. London cables report that stocks are decreasing. At the East, leading Southern furnaces are trying to combine so as to secure better prices for the future.

COPPER—There is nothing new to report. The consumption is steadily increasing. Eastern mail advices report an enlarging demand for wire bars. The New York *Iron Age* reports that the best part of 250,000 pounds have been taken at 12 1/2 cents for prompt delivery, while contracts involving June delivery were subsequently entered at 12 1/4 cents. The same paper says that this evidence of heavy consumption for electrical purposes is of more than ordinary significance, and, in connection with liberal use of the metal in other directions, gives tone to the market for Lake Superior product in the face of uncertainties connected with the alleged proposed international agreement for regulation of the world's production. The general impression is that there will be a livelier movement ere long and better prices, unless present indications as to consumptive requirements are greatly at fault. For the present, common casting brands are quoted at 11 1/2 cts @ 11 3/4 cts, and Arizona ingot at 11 3/4 cts, but consumers are shy in view of the close proximity of those prices to prevailing rates for Lake Superior ingot, and purchases are made only as imperative wants dictate.

COAL—Imports the past week are as follows: Tacoma 4700 tons, Seattle 3435, departure 2230, Baltimore 2900, total 12,255 tons. The market is reported to be showing more steadiness for cargoes in various positions. Unfavorable crop weather in the month just closing, if followed by dry and hot weather in June, will cause fewer ships to come to this port in search of outward wheat cargoes. With fewer ships coming, higher freights will have to be paid for coal shipments to this coast.

Eastern Metal Markets.

New York, April 27.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday.....	40	87 1/2	11 3/4	4 25	20 50
Friday.....	40	1-16	87 1/2	11 3/4	4 25
Saturday.....	39 11-16	86 1/2	11 3/4	4 25	20 70
Sunday.....	39 11-16	86 1/2	11 3/4	4 25	20 70
Tuesday.....	39 13-16	86 1/2	11 3/4	4 25	20 70
Wednesday.....	39 7-8	87 1/2	11 3/4	4 25	20 70

Copper is very strong. Lead is firm. Tin is stiff at a slight advance. Quicksilver is weak. There is a continued good demand for borax. Pig iron appears to have a better tone.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

VERY rich mineral is reported from Little Belt district, Montana.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, Silver Star Mining district, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 6th day of April, 1892, an assessment (No. 10) of Twenty five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 303 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of May, 1892, will be in default and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 31st day of May, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.
FREDERICK K. DUBROW, Secretary.
Office—Room No. 69 Nevada block, No. 303 Montgomery St., San Francisco, California.

DELINQUENT SALE NOTICE.

KEYSTONE CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, Amador City, Amador county, California.

Notice—The following are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the 9th day of March, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amount.
A. B. McCreery.....	8	2,334	\$5,836 00
A. B. McCreery.....	66	134	335 00

THE BLASDEL
CONCENTRATING BELT COMPANY

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksiver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco

F. A. HUNTINGTON, PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement is the best Ore Feeder now in use.

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to a very desired fineness by the centrifugal force of the rollers as they roll over it.

 Office of General Manager,
 P. O. Address, South Riverside, San Bernardino Co., Cal.
 CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
 I am, my Dear Sirs, Yours faithfully,
 S. HARRIS, Manager.

Gold Mining and Politics.

At the State convention of the Republican party at Stockton, this week, a Placer county miner was selected as chairman. Mr. H. Neff, who was chairman of the State Miners' convention, and is now president of the California Miners' Association, was chosen. In seconding his nomination, Mr. Murphy of Los Angeles, said: "We believe that every industry of the State should be protected and fostered, and with that view and overlooking our oranges and our fruits, we cast our eye to historical Placer, where the old '49ers made this country glorious once before, and Los Angeles greets Placer and seconds the nomination of Mr. Neff. Gentlemen, one word further before I sit down, so that we may know something of the sentiments that animate us. We believe that the mining interest of this State should be put upon its feet again. We believe that this can be done without destroying a single blade of grass, and to-day we not only second the nomination of Mr. Neff for the worth that is in the man, but we wish to say that the Republicans of Los Angeles county and the southern part of the State are in favor of lifting again to prominence the mining interests of this State, so that we can not only furnish the raisins

the world, the wine to the world, the wheat to the world, but that we can cut the cord that seems to worry the statesmen of our country to-day, and furnish the gold for the world."

One of the planks in the platform adopted by the convention is as follows: "We hail with glad hearts the cessation of legal warfare between the miners and the agriculturists of California, and the blending together of the two great interests of our commonwealth into one harmonious effort to advance the common good without injury to either. We indorse the efforts that have been made to bring farmer and miner into a union, and call upon Congress to enact immediately into laws such measures as will enable the hydraulic miner again to pour to the pathway of commerce his millions of treasure from the streams of the Sierra Nevada without damage to the valleys or to the agricultural interests of the State,

so that the busy hum of labor and the music of the school shall be heard in the now deserted mining camps of California, as in days of old."

While the MINING AND SCIENTIFIC PRESS, as a technical journal, has no special interest in political affairs, except as they influence the industrial features which it represents, it must congratulate the miners of California on the action of this convention. This action is but another indication of the great change of feeling which has taken place in the past few years on the mining question. Within two years the Legislature of the State has adopted resolu-

platform, such as appears in this case, did the former prejudice against the industry exist to-day. This is really another step in advance for the miners' cause, and one upon which they can congratulate themselves.

Open Hearth Metal.

The manufacture of ingot iron in the open hearth furnace is generally conducted in Germany by the Martin process, in which the pig iron is decarbonized by malleable scraps, commonly the crop ends and rejections of the mill's own productions. The regular pig-and-ore or Siemens proc-

The Mechanical Engineers.

The American Society of Mechanical Engineers holds its annual meeting this year in San Francisco for the first time. These meetings have been held in the principal Eastern cities, where the members of the society have been cordially greeted and entertained. The society has a membership of some 1400, embracing most of the prominent engineers of this country and abroad; men who are and have been connected with our greatest industrial enterprises. They are men of wide acquaintance and connection, able to influence the

opinion of thousands at the East. They come here to examine our public works and industries, and represent millions of capital invested in works of all kinds. Their visit here is the most important of the kind that has occurred, and must have a lasting influence upon our industrial interests. The sessions of the society will be held at the Academy of Sciences hall from the 16th to the 19th of May, inclusive. As their time will not all be taken up, during the day, the local mechanical engineers intend showing them what there is to be seen in and around the city. They must be received and entertained in accordance with the proverbial liberality of this city. Our industrial and com-

APPARATUS FOR INJECTING AIR INTO OPEN-HEARTH METAL BATH.

tions favorable to the hydraulic mining industry; the Governor of the State has officially favored it; the San Francisco Chamber of Commerce, Board of Trade and Board of Supervisors have lent it a helping hand, and the various counties of the State have given aid. Congress has taken the subject up and committees have reported favorably on bills to rehabilitate the industry. The politicians recognize the fact that the tide is in favor, and that the people and the press want to see a rehabilitation of gravel mining, since it is shown this can be done without the injury complained of in the past.

It is pretty certain that neither this nor the convention of any other party would have chosen as its chairman a man holding the relation to the mining community that Mr. Neff does were the mining industry in the position it was five years ago. Neither would a plank have been inserted in the

ess finds application only in isolated cases and to a very small extent. The practice of blowing air into the metal, which was used for some time in the Phoenix works at Ruhrort, required a special apparatus, found to be perfectly practicable, though the economic advantages could not be demonstrated. This apparatus is shown in the cuts on this page, as is the funnel for use with coal dust. The process is as frequently acid as basic; the latter method, however, is continually gaining ground, and it is especially interesting to observe that such works in particular as aim at only a small output, or have but small quantities of scrap to work up, prefer the basic process. To such an extent is this true that even in ordinary machine shops and foundries 1.5 and 2 ton open hearths are found in successful operation.

THE pressure in the natural gas well at Ogden, Utah, is very strong indeed.

mercial firms are asked to contribute to a fund now being prepared, and Mr. George C. Hickox has been authorized to collect subscriptions for this purpose.

In the construction of all sorts of machines and works, this body of men takes the most prominent part. There are members eminent in every branch of mechanical design. No such important body has ever come to this coast before. The various committees to assist in their entertainment will be selected this week, it being intended to apportion the work among the gentlemen connected with the various industrial enterprises of the city.

Thus far during the season about 80 men have started into the Yukon country from Juneau, Alaska. For the past six or seven years these diggings have attracted considerable attention, and from present indications will develop into a profitable field for the prospector.

Mining in Nevada.

Why It Does Not Prosper—Defects in the Laws.

The mining industry could be benefited by limiting the quantity of mineral land locatable, simplifying the method of acquiring title and requiring actual occupation and use as a condition to ownership. Prior to 1866, it was the settled policy of the United States to reserve the land bearing precious metals from sale. No other individual could acquire the fee title to the mineral lands. They remained public property, subject to the public control. The right to mine was a mere license suffered by the Government—a privilege which ceased when the individual enjoying it abandoned his work. The holding and working of mines was governed by the local rules and customs of miners adopted in district meetings and applicable to each locality. It was the object of these "local laws and customs" and the policy of the Government to encourage mining and enforce equality of rights; to secure to each miner actually residing in the district the possession of as much placer ground as he could reasonably work, and as much ledge or mineral-bearing rock as he could properly develop.

BUT ONE LOCATION

Could be made by the same individual on the same "lode." Each locator was required to personally "represent" his claim, and no location was valid which was not "represented" and worked in good faith. Placer claims rarely exceeded 50 feet in length, and were sometimes restricted to 15. Ledge locations were confined to the lode, and varied from 20 to 200 feet along the course of the vein. Under this system thousands of men were sometimes seen in a single gulch, each working his separate claim for his own account, and thousands of locators were often engaged in prospecting and developing a single lode. Thus,

SPECULATION IN MINES

Was restricted, legitimate mining encouraged, and employment given and wealth distributed among many people. In 1866, Congress changed the policy before existing, so far at least as related to the title to "lodes." It was then enacted that "The mineral lands of the public domain are declared free and open to exploration and occupation by all citizens of the United States and those who have declared their intention to become citizens."

It was also enacted "That whenever any person or association of persons claim a vein or lode, * * * having previously occupied and improved the same according to the local customs or rules of miners in the district where the same is situated, and having expended, in actual labor and improvements thereon, an amount of not less than one thousand dollars * * * it shall * * * be lawful for such claimant * * * to enter said tract and receive a patent therefor."

This act conferred the license of the Government to go upon the public land, search for minerals and appropriate them when found. It also conferred the right to

ACQUIRE THE TITLE BY PATENT

To a lode upon compliance with the local customs of miners and expending one thousand dollars in labor or improvements. The act of 1866 provided that "no location * * * shall exceed 200 feet in length * * * for each locator, with an additional claim for discovery to the discoverer of the lode;" and "that no person may make more than one location on the same lode, and not more than three thousand feet shall be taken in any one claim by any association of persons." But in 1872 the policy which had therefore prevailed of selling the mineral lands to actual miners in small claims, was completely reversed. It was then enacted "that a mining claim * * * whether located by one or more persons may equal but shall not exceed fifteen hundred feet along the vein or lode," and "three hundred feet on each side of the middle of the vein at the surface."

NO LIMITATION

Was put upon the number of locations of fifteen hundred feet each. An individual or association could make and one individual could acquire the patent title to as many claims as he desired the patent, carrying not only the ledge located but "all ledges * * * the top or apex of which lies inside of such surface lines."

Placer claims are "subject to entry and patent under like circumstances and conditions * * * as are provided for vein or lode claims." Thus every limit which the policy of the Government from its foundation had put upon the acquisition of the public mineral lands was swept away and the mines—placer and quartz—turned over

to speculators and monopolies. A single person or corporation can now locate and hold an entire gulch or mineral belt, and by doing the "assessment work" prevent any real mining being done. Patents can be obtained to an unlimited extent of ledges or placer ground, and thereafter the land held free of taxes, free of assessment work and free of development.

THE EVILS OF THIS SYSTEM

Are transparent and flagrant, the injury inflicted upon mining incalculable. In some localities, extensive placer regions are held by single corporations, and the precious metals, which should contribute to the prosperity of many, flow into the coffers of a few. In some mineral belts the ledges for miles in extent are located by a single individual. No actual mining is done. In many cases the annual work is not performed, but the claims are relocated from year to year. In every district locations are held without any intention to mine them. Thousands of claims have been patented, upon which no mining is done, and which have not been occupied for years. Many of these claims are acquired and held with no intention to work them, but with the hope that they may be made valuable by the industry of others in developments made on adjacent ground. Idlers and speculators are thus encouraged and profited; prospectors and miners deterred from making developments, and a blight put upon the prosperity of the whole State. The defects which I have pointed out in the mining laws should be remedied without delay, and the mining industry

RELIEVED OF THE IMPEDIMENTS

The law casts in the way. The quantity of land locatable and purchasable by one person should be limited, and but one location allowed to the same person on the same ledge. All locations should be plainly marked on the surface, and a written notice, accurately describing the claim, should be posted at the center and recorded on the land records of the county in which the claim is situated. Title should pass to the locator upon proof of location and occupation and payment of the price of the land; application to purchase should be made without unreasonable delay, or the location forfeited. A claim, whether held by patent or location merely, not actually occupied and mined in good faith, should be abandoned after the lapse of a reasonable time, and open to relocation. No locator should be permitted to twice locate the same ground. Above all, the law should be simple, certain and uniform in its operation, leaving as little as possible to construction and nothing to district rules. In short, the mineral lands should be held for legitimate miners; the right to locate and purchase, and extent of location, should be limited; those who claim the lands should be required to mine them; those who do not intend to mine should not be permitted to obstruct those who do.—Robert M. Clarke, in Reno Gazette.

Points in Testing Granite.

A very important point to ascertain in comparing results of experiments of different kinds of granite is whether all the materials under experiment are actually granites. It is not near enough, even for practical purposes, to admit other kinds of stones, simply because they may be known in the market as "granites," into the comparison.

The results of resistance to thrusting stress are of no real value unless stones of approximately similar mineralogical composition are tested. For instance, granite should be compared with granite, syenite with syenite, greenstone with greenstone, and so on. This leads to the conclusion that, in respect to granites, the crushing weights on six-inch cubes are useful only for comparison of the finer-grained varieties, and any one who is selecting stone should therefore know the grain of the rocks, the results of compression of which he is comparing.

It is often found useful to know the weight of stones, because to a certain extent it is an index to their durability. Many published results show the average weight per cubic foot, while others give the specific gravity. The trouble of preparing several samples of hard stones, making them of the required size and shape, in order to find their average weight, is a drawback to the former method. The latter method is, perhaps, the preferable one, for not only can the stones be of irregular shape, but when an average piece is carefully selected, more accurate results are obtained.

The specific gravity of a substance is its weight compared with that of an equivalent bulk of pure water, at a definite temperature and pressure. The density of a rock or mineral depends, to a great extent, on chemical composition and minute structure.

The stone to be weighed must be an

average-looking specimen, because two fragments of the same rock may contain different proportions of its constituent minerals.

The most convenient way of finding specific gravity is by weighing the same specimen first in air, then immersed in water, and dividing the former weight by its excess above the latter.—Geo. F. Harris in Stone.

Mexican Mining Laws.

The new mining law promised in the presidential message is finished, and will be presented to the Chamber at once. The law enables the consolidation of mining property and the leveling of it to the position of ordinary real estate, the only restriction being the payment of an annual tax.

The renoucement of the mine system now used, obtains for the miners the right of encroachment which, according to the old Spanish law, allowed mine owners when following the working of a vein to cross or even work on strange property.

The law also, in place of restricting the formation of mining companies, provides for the free working of mines, mortgaging them, if need be; in fact it provides for all that tends to facilitate the investing of capital, and for the granting of all kinds of securities; thus simplifying the possession necessary to secure formalities of and to work mines.

Track laying on the Southern Railway is proceeding rapidly. Rails for the Inter-Oceanic Railway have arrived and track laying on the extension from Matamoros toward the Pacific has commenced. A mining exchange is to be established at the City of Mexico.

THE GARBERVILLE OIL WELLS.—P. J. Wood, now of Garberville, who was a resident of Sonoma county when Mendocino county was included in its boundaries, is now visiting John McMinn of this city. Mr. Wood removed to the south fork of Eel river in 1860, and was the first settler in or near the present site of the town of Garberville. He has secured a very large range near that place, and has it stocked with cattle, sheep and horses. When Mr. Wood first went to the South Fork, the Indians were numerous and hostile, and he joined the soldiers as a volunteer in the troubles with them in 1862-63. There is considerable interest in that section in oil wells. A company is organized, and at work there, known as the Humboldt Oil Company. It has spent several thousand dollars in boring apparatus, and has gone down between 500 and 600 feet. It struck oil at a depth of 400 feet, but was going deeper in expectation of a larger supply. It is equipped to go to a depth of 2000 or 3000 feet if necessary. The oil is said to be of very superior quality, much above the average of any oil yet found in this country. The company is working quite a large force. The members are all Eastern men, and have had much experience in the business. They regard it as the best indication on the Pacific Coast.—Sonoma Democrat.

GOLD SHIPMENTS.—A dispatch from New York, dated April 22d, says: Landenberg, Thallman & Co. have ordered \$255,000 in gold coin for shipment to Europe to-morrow. Lazard Freres have ordered \$1,250,000 gold for export to-morrow. The total to-day is \$1,505,000. In regard to the orders for nearly \$2,000,000 gold for export to-day, the *Post* says: A new movement of gold to Europe will begin to-morrow, and the occasion for the movement is probably the same as in the case of the February exports; that is to say, the gold is either to be sent to Austria or to be held in other financial centers to replace gold already forwarded. Whether Vienna's operations are the sole basis for the orders is not so certain. The largest shippers by to-morrow's steamers are the bankers who managed last year the heavy gold exports to France. These bankers did not participate to any extent in the February shipments, which went chiefly to England and Germany. To-morrow's exports go almost entirely to Paris, and the bankers admit that the movement will continue for some time. In itself the export of gold at this season of the year is too familiar a spectacle to excite remark, but it is interesting to observe that the current rates for exchange, like the rates under which last year's gold went out, are below the level of profit on ordinary shipments.

SAW FOR NICKEL-STEEL.—Last week there was placed in the Homestead Steel Works of Carnegie, Phipps & Co., Limited, at Homestead, Pa., an important piece of machinery of which there is no duplicate in the United States. It is a steel saw weighing 110 tons to cut nickel-steel armor plate. These armor plates range in weight from 8

to 38 tons, and reach a length of 20 feet and a thickness of 20 inches. The saw has a blade 7½ feet in diameter, geared above and revolving horizontally. The armor plate when about to be sheared is placed on a tilting-table, which is adjustable to any angle, and presented to the edge of the saw, endwise. The forward motion of the carrying-table thrusts the plates steadily against the flying teeth, and an angular slab of cold nickle-steel weighing several tons is removed in much the same manner as the end is taken off a pine log in a sawmill. It is to be used also for cutting plates into any desired dimensions. This machine was imported from Germany and is said to have cost about \$35,000.—Iron Age.

Patent Interferences.

The report of the Commissioner of Patents is an admirable piece of work, but there are two of his recommendations for legislation which we cannot pass by without condemnation. One of the most revolutionary changes which he suggests is that of transferring interference proceedings from the patent office to the courts. We urge against this change the consideration that the courts are overburdened already. There is little room for doubt that the delays in the prosecution of interferences, delays which are now often avoidable, would then become necessary, so that patents would issue still further away from the dates of application. It sometimes happens under present conditions that applications are held in interference for as many as ten years. Under the proposed plan, we might expect such a state of things much more frequently. Do inventors want any legislation which will tend to delay the issuance of patents?

But, above all, do inventors want such dilatory legislation, coupled with penalties under which they, the irresponsible and unwilling parties, are to suffer? Yet, this is what would follow, if the commissioner's recommendations were to be carried out in their entirety, for he advocates in connection with the above measure the passage of a law which shall limit the life of a patent in all cases to no more than twenty years from the date of application. We can fancy the impotent rage of an inventor just emerging from the vexatious delays of a long interference on finding that his patent has only twelve years, say, to run.

A bill embodying Commissioner Simonds' recommendation has been introduced in Congress, and we are informed that inventors all over the country have been invited to signify their approval of the measure. We advise inventors to be very careful how they give their approval of the two clauses referred to in the foregoing. The other recommendations are all good and desirable, but we are convinced that to secure the passage of these two clauses would be jumping out of the frying-pan into the fire.—Electric Power.

The Big Telescope for Mt. Wilson.

Hon. E. F. Spence has been seen by a Los Angeles *Herald* reporter relative to the statement from President Eliot of Harvard College, referring to the plan of establishing an astronomical observatory on the top of Mt. Wilson. It was suggested in the article mentioned, that it would be well if Mr. Spence and President Eliot could come to an understanding and consolidate their plans, producing one grand observatory, which would excel anything of the kind elsewhere.

"I am perfectly willing to unite with Harvard," said Mr. Spence, "but I want the University of Southern California to receive some credit in the matter, for it was to the university that I gave the endowment for the forty-inch glass. The observatory should be the most complete in the world, it should be one where every one, from the man who carries the hod to the scholar, could have an opportunity of observing the wonders that God has put into the heavens. It may be that the plans of both Harvard and the local university can be combined; if so, I shall be very glad."

"The great lens, the first of the two which make together the forty-inch glass, is all safe in the shop of Alvan Clark's Sons in Cambridge. The second lens was being constructed in Paris recently by Mantois, and while it was in the furnace, it exploded into a thousand pieces. This so upset Mantois that he left Paris and disappeared for six weeks, when he returned and commenced work again. This second glass is, comparatively speaking, easy to make; the first one was the most difficult to make, and that is all right. We might have waited 40 years before getting such successful results as we did."

The Colorado Silver League.

An Address to the Wealth-Producing Voters of the Nation.

The Colorado State Silver League, on behalf of an army of Colorado voters, sends greeting:

We have undertaken a great work in your behalf as well as in our own, and it is to secure your active cooperation in that work that we come to you with this earnest appeal. We have common interests, and those interests have a common foe. It is for the laudable purpose of asserting and maintaining our rights that we are banded together. Will you not join us?

In consequence of one deliberate, cowardly blow, dealt by the hand of organized avarice, we have for years been groveling at the feet of insolent, unscrupulous money-changers, whose openly avowed purpose it has been and is to control and contract the world's volume of circulating money.

With that end in view was the demonization of silver accomplished. The foul means which were used to achieve that purpose are too well understood to require discussion here.

The disastrous effects of that iniquitous scheme have been felt by each one of us. To-day they are plainly visible on every hand, in the depreciated value of almost every commodity produced by the labor of human hands, and especially in the ruinous prices of wheat, cotton and silver, as well as in the constantly falling prices of agricultural lands, mines and labor. The distress and suffering which it has bred throughout the nation is beyond the power of the human mind to compute.

Year after year we have gone regularly to the polls and persistently fought each other, while working for the supremacy of one or the other of the two great political parties instead of standing shoulder to shoulder to meet and resist the attacks of one common enemy. Those parties, as they exist at present, deem the spoils of office of paramount importance to the welfare of the people. They are maintained chiefly for the benefit of self-seeking politicians, whose most lofty ambition is paltry office. To attain that end they do not hesitate to persistently betray the interests of the people whose aid they solicit into the hands of the money power. They are partisans for revenue only. At the bidding of this same money power, they have placed the General Government on a level with the stock broker; they have rendered thousands of families homeless; they have changed the toiling debtor into a cringing mendicant, and from the ranks of toiling labor they have recruited an army of tramps.

If a traveler was ever robbed on the highway, then the silver miners of our country—loyal, patriotic citizens—are now being robbed by the General Government at the rate of \$20,000,000 a year. If, then, the silver miners have just cause for complaint, what shall we say of the cotton growers of the South, who lose more than four times that amount annually; or of the wheat growers of the North and West, who year after year have filched from their earnings more than five times the annual loss of the silver miners? Figures grow bewildering. But if the miners, planters and farmers have suffered a loss that the human mind cannot comprehend, what shall we say of the 2,000,000 of idle laborers? Not less than twenty-four millions a week is the loss of the wage earners, the producers of wealth.

In the face of these exasperating outrages, what use have we for political parties—so long as those parties are dominated by the people's unscrupulous foe?

The people have complained, and their complaints have been met by sneers; they have murmured, and their murmurs have encountered derision.

We are now fully convinced that further submission to these grievances is simply to bare our backs to the lash of insatiate greed. Yes, it would be to pursue a course unworthy of Americans, and unworthy of the manhood which we boast.

There are, at this time, in the State of Colorado upwards of 40 nonpartisan silver clubs, and the number is daily increasing. They have an aggregate membership of over 20,000 voters. Each member, upon joining, pledges himself in writing that until this question shall be settled, and silver restored to its rightful position in the money of the nation, he will vote for no candidate for any important position who is not fully committed to the remonetization of silver. In addition to this, representatives of these various clubs assembled in the city of Denver and perfected the organization of a State Silver League. They also issued a call for a State Silver Convention—to assemble in this city on the 25th of April, prox.—upon a basis of representation from the various county and local organizations.

This organization, however, asks no member to forsake his party affiliations until the forthcoming National Convention shall have neglected or refused to comply with our request for the nomination of a free coinage candidate for the presidency, on a free coinage platform. With that end in view, we urge the most perfect county and precinct organization. We urge the most faithful and diligent attention to the primaries, to the end that the County and State Conventions may not be controlled by professional politicians. We urge that the delegations to the National Conventions shall be composed of the very best men that the respective parties of our State can produce, always giving due notice, however, that no candidate whom such National Convention shall nominate shall receive our support at the polls unless he shall unqualifiedly favor the full remonetization of silver, and shall stand squarely on a free coinage platform.

We further urge that Colorado delegations to the National Conventions shall make it a point to confer with the delegates from all of the other Western and Southern States, who should represent the wealth producers instead of the money power, to join them in caucus, to the end that they may act as a unit in making their demands and representing the sentiments of the voters of their respective States and Territories.

And finally, we urge upon each individual member of our organization to regard his written pledge as absolutely sacred, and to be faithfully redeemed at the polls in November next, even to the support of a third party candidate for the presidency, should such a course be necessary.

Now, we come to you, and respectfully but earnestly urge your hearty and prompt cooperation in this great work. We ask you to organize at once. Organize silver clubs in every city, town, village or mining camp, yes, in every neighborhood. Let county and State organizations follow immediately after. Organize at once in order to do effective work at the primaries—both Republican and Democratic—to the end that your voices may unite with ours, and that our combined influence may be felt at both Minneapolis and Chicago. If the hitherto Republican States west of the Missouri river will but enter into this work with the same spirit that pervades the voters of Colorado, we will present a force at Minneapolis that will at least command respect. Remember that the vote of these States is absolutely necessary to the life of the party. Then, if the voters of the new South will, on their part, enter as heartily into the work, they can accomplish quite as much, if not more, at Chicago.

Only last month the commercial price of silver fell below 90 cents an ounce—the lowest price reached in the history of the world. From that point it has constantly and rapidly fallen until, at this writing, it is worth but 85 cents an ounce, and the finger of the oppressor still points downward.

For that reason, mines are being closed, miners' wages are being reduced, and in many instances they are being discharged.

Within the ranks of this class, then, the force of this appeal will be felt. But the business man will be brought to a realizing sense of the situation in very short order. Business stagnation is inevitable. The farmer will plant and reap, but his crops will rot on his hands, or be sold at a price far below the cost of production. More laborers will be out of employment.

Now, look around you, and judge for yourselves whether or not this appeal is timely.

Politicians tell you that "the tariff is the leading issue." The tariff, like the poor, is always with us. We assert that silver is the issue. Forty millions of the American people demand its immediate remonetization.

Shall we continue to act at cross purposes, or shall we join hands for the common good?

By order of the State Executive Committee.

M. H. SLATER, Chairman, Denver.

J. H. ERNEST WATERS, Telluride.

ARCHIE C. FISK, Denver.

HENRY PAUL, Aspen.

W. C. WYNKOOP, Denver.

NEW FRENCH IRONCLAD.—A new French battleship, to be called the *Masena*, is to be at once laid down at the building-yard of the Societe des Chantiers de la Loire, and, according to the terms of the contract, is to be completed within five years. The plans have been prepared by Mons. du Bussy, who has designed all the most recent French ironclads. The principal dimensions of the vessel will be: Length, 363 4 feet; breadth, 65.6 feet; draught of water aft, 26.2 feet; displacement, 11,700 tons. There will be three screws driven by engines which, with 16 boilers, will develop under forced draught a maximum of 11,000 horse power, and a speed of 18 knots. There will be a com-

plete water line belt of armor of a maximum thickness of 17.7 inches. The armament according to the *Times*, will be composed as follows: Two 11.8-inch guns, one forward and the other aft, in covered sponson barbettes; two 10.6-inch guns in covered sponson barbettes, one on each broadside; eight 5.5-inch quick-firing guns in sponsons, four being on each broadside; four smaller quick-firing guns of 3.3 inch (20-pounders) four of 2.6-inch (9 pounders) and twelve 1.8-inch (3-pounders), and ten Hotchkiss revolving cannon of 1.46-inch (1-pounder). The vessel will have four torpedo ejectors, two forward and two aft, and will be the first ship in the French navy to be provided with submerged tubes. A sister ship to the *Masena* will be laid down later in the year.

CAVIAR.—Caviar, which is made from the eggs of the sturgeon, is an important article of exportation for many cities of Russia and Astrakhan, and principally Taganrok. The annual amount is estimated at 40,000 poods (1 pood = 36 pounds). The greater part goes to Turkey, Greece, Italy, and Germany, very little to England and still less to France. The fisheries are situated at the mouth of the Volga, upon the banks of which stand vast storehouses with basements and cellars in which are found the tubs that contain the brine used in the preparation of caviar. The most profitable fishing is done in autumn, this season yielding the largest quantity of eggs. In winter, the fishermen make large holes in the ice and fish with the spear. At all other times they use nets, about 300 feet in length, to which are attached cords provided with hooks. Each of these is strong enough to hold a fish of large dimensions. Each establishment owns a fleet of boats. The fishes brought on board are laid upon boards and covered with salt, and are then opened for the purpose of extracting the eggs and the entrails, which the Russians are very fond of, and which they eat in a fresh state. For exportation, caviar is prepared in two different ways: 1. The eggs are washed and then immersed in strong brine for three-quarters of an hour and finally allowed to drain. In this way "granular" caviar is obtained. 2. For "compact" caviar, the eggs are first cleansed, then pickled and finally allowed to dry slowly. Then they are packed closely in canvas bags which are inclosed in wooden barrels, after which they are ready for shipment. A ruder process, but one much used in the trade, consists in immersing the eggs, immediately after collection, in brine, wherein they are left for several months, after which they are dried in the sun.—*La Nature*.

NIAGARA FALLS POWER.—The *Manufacturers' Gazette* says: It is stated that the commissioners of the Queen Victoria Niagara Falls Park have given their consent to the introduction of a bill to the Ontario Legislature, which will create the Canadian Niagara Power Company. This company will retain the exclusive right to develop the power of the cataract on the Canadian side of the river, under an irrevocable license. The company will be capitalized at \$3,000,000, and includes many men who are identified with the most prominent in American business circles. The company will pay \$25,000 rental per annum for the first decade, the rent to be computed from the first day of the approaching May, and it has been agreed by the commissioners to accept the first two years rent in two payments of \$15,000 and \$35,000 each. The rental for the second 10 years increases \$1000 each year, until at the close of 20 years it is \$35,000, at which rate it will be continued. The company undertakes to begin work on or before May 1, 1897, and to proceed so far that on November 1, 1898, it will have completed water connections for the development of 25,000 horse power, and has actually ready for use and transmission 10,000-horse power.

SODA.—That soda barrel is good for lots of things besides cleaning files; whenever a lot of greasy repair work comes along, such as boxes to be babbited, bolts and nuts to be tinkered up, just put them in the soda barrel, boil ten minutes, rinse a little with hot water, and the work will be as free from grease as if such a thing never existed. When the oil stone gets filled with oil, a boil in the soda barrel will take out all the grease, and make the stone cut much faster. The overalls that are full of grease and dirt can be cleaned in a short time by boiling in the soda, but it will not do to use the strong solution for this business, or the cloth will be dissolved as well as the grease. Take one quart of the strong solution, put it in two pails of water, and boil the clothing in that. Usually it will do the business. If it does not, add a little more strong soda and try again.—*Blacksmith and Wheelwright*.

THE ORIGIN OF THE WORD "CALICO."—In the year 1489, just ten months and two days after leaving the port at Lisbon, Vasco da Gama landed on the coast of Malabar, at Calicut, or, more properly, Khale Rhoda, "City of the Black Goddess." Calicut was at that time not only a very ancient seaport, but an extensive territory, which, stretching along the western coast of Southern India, reached from Bombay and the adjacent islands to Cape Comorin. It was at an early period so famous for its weaving and dyeing of cotton cloth that its name became identified with the manufactured fabric, hence the name calico. It is now generally admitted that this ingenious art originated in India, in remote ages, and from that country found its way into Egypt. It was not until the middle of the seventeenth century that calico printing was introduced into Europe. A knowledge of the art was acquired by some of the servants of the Dutch East India Company and carried to Holland, whence it was introduced in London in the year 1676. It is surprising for grown-up children, as well as our young folks, to learn that "Pliny, as early as the first century, mentions in his natural history that there existed in Egypt a wonderful method of dying white cloth." Calico cannot be despised when it boasts of such antiquity. The shoddy make-up of the present day may look down with contempt upon the calico dress, but "what kind of lineage has it?" the calico can proudly ask.—*Draper's Record*.

MCCLOUD RIVER PLATEAU.—The construction of the railroad to tap the immense pine forests of the McCloud river plateau, south of Mt. Shasta, will be begun at once. The right of way for building the line up the Soda creek canyon has finally been secured, and the first section of the road, 2.1 miles long from its junction with the main line at Castle Crag Tavern at the mouth of Soda creek, will be built immediately by the Southern Pacific Company. The road is to be built to this point by the Southern Pacific Company under a contract between the company and Tatum & Bowen of this city and miller and Brewster of Wisconsin. The lumber people will erect their first sawmill at the terminus of the first section, and will then continue the construction of the line through 28 miles of forests of immense pines, the whole to be completed by September 1st of this year. At convenient intervals along the line sawmills will be set up.

SATISFACTORY TEST.—A test of 100 tons of ore from the Hale & Norcross mine crushed at the Occidental mill is completed, and 80 per cent of the battery pulp assay value was returned in bullion, notwithstanding that the grade of ore was very low, averaging only \$15 per ton. This is fully 20 per cent more than bullion returns secured from much higher grade Hale & Norcross ore crushed at the Nevada mill under the former management of that mine. Then less than 60 per cent pulp assay value was returned in bullion. This very satisfactory test will result in the Hale & Norcross company leasing the Occidental mill, which has an ore-crushing capacity of 70 tons in 24 hours. The lease will specify that sulphurets concentrated from ore tailings escaping from the amalgamating pans will belong to the Hale & Norcross shareholders.

A DISINFECTANT.—Nitrous acid as a disinfectant had been proposed some years ago because of its peculiar property of being an oxidizing as well as a reducing agent. H. Borntrager employs the following combination containing 20 per cent sodium nitrate: One part sodium nitrate and one part gypsum are melted together; after cooling the mass is powdered and preserved in well-stoppered receptacles. Two parts sodium bisulphate and one part gypsum are also melted together and, after cooling, powdered. Both powders are now mixed and preserved in dry and tightly-stoppered containers. If this powder be thrown into water or substances to be disinfected, a uniform evolution of nitrous acid takes place, which rapidly destroys foul odors.—*Pharm. Centralhalle*.

FRICTION IN RIFLES.—In consequence of the enormous initial velocity of the bullet in the new Mannlicher rifle, and the resulting friction and wear on the barrel, it has become necessary to devise some method preventing both of these evils. The manager of the Government Laboratory at Thun, Switzerland, has consequently devised a method of enclosing the leaden bullet in a thin metallic covering, while over this he places a wrapper of specially prepared oleaginous paper, which reduces the wear of the rifle barrel to a minimum, without interfering with the course of the bullet.—*Manufacturers' Gazette*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

DYNAMITE AT THE HECTOR.—Cor. Amador Leager, April 30: One of the most dastardly outrages ever committed in this county was perpetrated about half past 10 o'clock on Friday night, at the Hector mill. To form a clear idea of the mischief wrought, it will be necessary to briefly explain the situation at the mill. The rock which supplies the mill is from surface cuts, and the loaded cars from the ore body reach the mill nearly on a level with the ground floor. It has, therefore to be raised up some 20 feet to the dump which supplies the feeders. For this purpose an elevator, operated by water power, has been in use, and has worked to a charm. This elevator was one point of attack. Then again the large pipe, which supplies the mine with water power, branches into two separate pipes 100 feet or so in front of the mill, one pipe running the hoist, and the other the mill machinery. This point of junction was the second place of attack. At the hour above named, some malicious scoundrel stole around the mill and dropped down the cylinder of the elevator two or more giant powder cartridges with not less than 25 feet of fuse attached thereto. He then hurried to the junction of the pipes, and laid another cartridge thereon, with ample supply of fuse to enable him to get at a distance from the scene of operations, if necessary, before the explosion. The reports were about one minute apart, and were very different from ordinary blasting, and awoke a number of the sleeping inhabitants. The elevator was completely demolished, the large castings being blown into fragments. The pipe was also destroyed at the junction place.

GOVEA.—Ledge April 30: A large cave occurred at the Gove mine during the night of April 17th. Some rich ore was being taken from the 700 level, and whether, in the excavation of this rock, the work of timbering was not kept up as closely as it should have been, we are unable to say. At any rate, an immense cave occurred, involving the ground between the 700 and 600 levels. Fortunately, no one was at work there at the time, and consequently no one was injured. The cave puts a veto upon the extraction of the rich ore, until such time as a new tunnel can be opened up into it.

MISCELLANEOUS.—The shaft of the South Eureka is down 520 feet. It is the intention to sink 10 feet more, to make a sump of 30 feet, after which drifting for the ledge at the 500-foot level will be commenced. The indications are very flattering for the opening up of a valuable property. It is reported that the control of the Plymouth consolidated has passed out of the hands of Hayward & Hobart to the New York stockholders. If so, the property will likely be started up again soon under the new regime. Albert Brown is opening up a chrome mine in the neighborhood of Finn's ranch, below Drytown. Chrome or chromium is a metallic substance largely used in the coloring of glassware and the printing of fabrics. None of the mineral has been shipped as yet, but there is a considerable body of it, and it may turn out an important and valuable property. Dr. Bardeue is in Jackson looking after his interest in the milling of the black metal at the Amador Queen. The crushing is almost completed. The percentage of sulphurets is heavy, from five to six per cent, but the yield in free gold is not yet determined. At the Kennedy, the system of water pipes has been materially extended. The Zeile mine had over 130 names on its pay roll last month. It is by far the heaviest employer of labor in the county.

Calaveras.

S. S. VALLEY MINES.—Calaveras Citizen, April 30: The Pine Log mill is crushing very good ore from the mine. A new shaft is to be started on the Park and Bulger mine soon; considerable prospecting is being done on the numerous claims in the vicinity. The Justice mine is being prospected by an old veteran prospector of 40 years' experience in quartz, who has uncovered an immense body of ore, extensive in width and length, and prospecting well in free gold. Judge Keane of San Andreas is one of the fortunate owners.

El Dorado.

HARMON.—Mt. Democrat, April 30: At the Harmon mine, work has been suspended, at least for the present. Tests made recently did not give returns such as to justify further development, hence the suspension. At the Gentle Annie mine they are still taking out ore that runs high, and the prospects are that this low-grade mine will develop into a high-grade property.

DALMATIA.—W. H. Husbands, Supt. of the Dalmatia mine, returned from England two weeks ago to-day, in response to a telegram to him while in London announcing the rich strike in the Dalmatia. After his arrival he panned out over 70 ounces of gold in two days. Some of the specimens are declared to be dazzling in their beauty. The proprietors are to be congratulated that the strike occurs simultaneously with the extensive improvements under way at this mine.

Humboldt.

KLAMATH AND SALMON.—Blue Lake Advocate, April 30: M. L. Welch came down this week from the mining section of Northern Humboldt and Northwestern Trinity. Mr. Welch has been as far on the Klamath as Happy Camp, and as far up the Salmon as Sawyer's Bar. Mining matters at Happy Camp are quiet. Only a couple of Chinese companies are doing anything there. At Orleans a number of mines are in operation and are paying fairly

well. The big mine of the English syndicate is idle. Nothing has been done by its owners for development of it since the ditch broke two years ago. Prospecting at Sawyer's Bar has resulted in the location of several new claims, besides, a wagon road to connect with Etina is in course of construction, which is expected to be a great convenience. It will give the people of Sawyer's Bar continuous wagon road to Yreka and Redding.

WILLOW CREEK NOTES.—Blue Lake Advocate, April 27: C. S. Little came down Tuesday from the mining section on Willow creek, where he has a claim. He informs us that the Van Vecker party who passed through Blue Lake on Friday of last week, en route to the mines on Willow creek to locate a ditch, is still there, and will probably stay some little time yet. Confidence is now shaken in the belief that there is gold in paying quantities all along the creek, and that only capital is needed to develop the mines there. Miners believe the bonding of the mines and the consequent expenditure of some thousands of dollars in their development will be a good thing not only for the syndicate, but for the county at large. It has been generally supposed that mining there would be confined to operations in the bed of the stream, but Mr. Little says that a paying lead or two have lately been discovered on sand bars 10 and 15 feet above the present creek bed.

Lassen.

A GYPSUM MINE.—Lassen Advocate, April 28: From James Elledge, who came up from Amedee yesterday, we learn that he has unearthed the croppings of a fine gypsum ledge in the Cottonwood mountains, about 50 miles south-east from Amedee. He made the discovery some time ago, but because of his inability to judge correctly of the extent and quality of the ledge, he refrained from making the matter public. Last week, however, he, in company with lower county capitalists, repaired to the scene, and remained long enough to form a correct idea of the merits of the find. There are surface croppings, he says, covering a space of about 40 feet, and on examination it was found that a ledge about six feet wide was leading from these croppings into the mountain sides. The capitalists who were viewing the scene were very enthusiastic over the affair, and no doubt Jim will realize a good thing out of his mine. Gypsum is a very useful material, and if this find is properly utilized, it will be a good thing for this part of the country.

Nevada.

CENTENNIAL.—Grass Valley Telegraph, April 29: The Centennial Mining Co. operating on Osborn Hill is about to resume work. Last summer fine hoisting works were erected on this property, and the incline shaft cleaned out and retimbered down to the water level. All this work was done in that first-class manner for which Supt. Stoddard is noted. During the past few months the mine has been idle, owing to the inclemency of the weather. Now that the spring time is upon us, many new enterprises are about to go ahead, and among them is the Centennial. It is proposed to erect a five-stamp mill and begin active work early next month.

A DIVIDEND.—Herald, April 28: The Omaha Gold Mining Co. of Grass Valley has declared its sixth dividend of 15 cents a share. The mine looks well.

WASHINGTON MINAS.—Things are brightening up at Washington. There have been several good strikes lately which are very encouraging. We hear to-day of a new strike in gravel, but can get no particulars yet. Williamson and Cole have struck a big thing in their quartz claim, and everybody is talking about it. We know of at least one new mill to be built this summer, and possibly a second one. Taken altogether, Washington district bids fair to have a good season.

BRUNSWICK.—Grass Valley Telegraph, April 30: To-day, Major Fitzgerald brought to town some very superior milling ore, which was taken from the ledge in the 600 level of the Brunswick mine. The ledge at the point from where the rock came is about 14 inches thick. The quartz shown us to-day has plenty of sulphurets in it and shows gold all through. The Brunswick is being systematically and carefully worked.

MOUNT GEORGE.—The Mount George mining claim is situated on Rush creek, near where that stream empties into the South Yuba river. The claim is near the Yuba bridge, on the new road to North San Juan, and is about two miles and a half west of Nevada City. This claim was owned by George Joseph, who is now deceased. Friday evening the claim was sold by the administrator in the Joseph estate to E. L. Goldsone, John E. Carter, Fred. Zeldner and Dr. W. C. Jones. This ledge has not been prospected to any great extent, as the shaft is down only about 30 feet. Yet, several thousands of dollars worth of gold has been taken out of that shallow shaft. The new owners propose to prospect the claim thoroughly and will begin sinking the shaft deeper in a few days. There is a Pelton wheel on the claim that runs a light hoisting gear.

Placer.

DUTCH FLAT.—Cor. Auburn Republican, April 29: Will Runkel has struck it rich in his mine about one mile above the mouth of Humboldt canyon. He brought in some rock last week, and it is as fine as any that has ever been seen here. The ledge is three feet wide, and has been traced far enough to satisfy Mr. Runkel and expert miners who have seen the ledge that it is something permanent. Plenty of free gold can be seen, and some of the rock in which no gold could be seen has assayed \$30 per ton. J. E. Doolittle is a partner in the rich find, and they will commence at once to put it in proper shape for working.

Plumas.

A RICH PROPERTY.—Bulletin, April 28: The Homestake mine at Granite Basin, recently

purchased of Mr. Swan by Horace Waldron, is developing into a very rich mining property. During the past winter Mr. Waldron has been doing development work and extracting ore. The tunnel from the west side is now in 200 feet, with a ledge 18 inches wide and backs 60 feet high. The ore is of high grade. With 130 tons of ore on the dump, and such a fine showing in the face of the tunnel, Mr. Waldron is confident of a fortune. He will fit up his small mill to begin crushing soon, but hopes to erect a ten-stamp mill with such reduction works as will save all the gold.

GENESSEE.—Cor. Plumas National, April 25: The mill at the Grass mine was started up last week, having been bung up but a few days. A good deal of ore is being taken from the surface of a ledge in the North Hill. Mr. Knox is foreman of that part of the mine. Mr. George Brown, "tell George," has a contract, and is getting out timbers for the mine. Most of the mines on Grizzly creek have commenced work for the season. I am informed that Dean & Co. will commence work at the old Peel diggings in a few days. Mr. Sipes is getting some very good ore from the old waste dump of the Green ledge. Work at the McDonald mine is rapidly progressing under the direction of Mr. George Sanger.

San Bernardino.

NEW MILL OF THE NEEDLES CO.—Needles Eye, April 27: Last Friday will long be remembered by the good citizens of the Needles as the day which, in all human probability, marked a new era in the mining industries of this section of Southern California. The occasion was the trial work of the new mill of the Needles Reduction Co., and it goes without saying that the trial was perfectly satisfactory. To make the occasion more impressive, Pres. Isaac E. Blake of Denver, Colorado, accompanied by Mrs. Blake and their little son, Vice-Pres. Purdy of the Chicago, Rock Island and Pacific railroad, Miss Fanny Purdy, Mr. Ferguson, a Denver banker, Mr. Crosby, a New York capitalist, and a large concourse of Needles people, and miners from the neighboring mountains, all assembled at the mill Friday afternoon at 3 o'clock, to witness the interesting first work. As soon as the steam was turned on and the machinery started, Mr. Morgan, the superintendent, placed the first sack of ore near the bopper of the crusher and gallantly handed Miss Fanny Purdy a shovel, with which she accomplished and graceful daughter of the Rock Island's popular vice-president fed the contents of the sack to the crusher. Twelve sacks of ore were thus fed, and in a very short space of time were ground up to a fine powder. The ore was from Dan O'Leary's up-the-river mine, and the rock was pronounced the hardest and most difficult to crush that the mill will have to handle in this section. Yet the crushing process was complete and highly satisfactory.

CARLISLE.—Cor. Times-Index, April 30: W. H. Alesworth came in from the Carlisle mine last Monday and reports good progress in the work of developing, they having gone down 40 feet on the ledge, and find the vein widening, as it starts in on the surface about 1½ feet wide and is now 31 feet wide. The rock assayed from \$22 to \$185 per ton on the surface croppings. Mr. Alesworth thinks it will not assay quite as high on the 40-foot level, but thinks it rich enough to keep developing, and will go down to 60 feet, when he will run a drift 1500 feet long on either side of the shaft, and, if the ore holds out as good as indicated at present, will put up a mill on the mine and open up a camp there. The mine belongs to S. G. Burt, an old prospector in that country, and is situated about three miles east of the Virginia Dale mill. McKee & Alesworth, two practical mining men of Los Angeles, received an option on the claim and are developing it. John Wilson, another old prospector in the Twenty-nine Palm country, was in Banning last Monday and reports the Twenty-nine Palm Mining and Milling Company making good progress on the mill they are erecting at Twenty-nine Palms. They are putting up a Byran mill equal in size to an eight-stamp mill, and will have it in running order about June 15th or July 1st, when they will run from eight to ten tons of rock through the mill per day. They propose to work eight men in the mine and three men in the mill, which is located in the best place on the desert for a mill, there being an abundance of splendid water near at hand and wood within a few miles, and the mines they propose working are all above the mill, giving a downhill pull to the mill with the loads of ore; but they are making a grand mistake in not putting in concentrators, as they can save only the free-milling ore with the process they are going to employ. This is what has caused the Virginia Dale mine to be unprofitable, for the assays made of the quartz show that the precious metal is there in paying quantities, and the fact that it is unprofitable to run the mill is prima facie evidence that there is a loss of gold somewhere in the milling, and this is where it is.

Siskiyou.

TO DAIRY.—Siskiyou Telegraph, April 30: J. O. Whitney, Supt. of the Scott River Mill, Ditch and Mining Co., was in Yreka last Monday. Mr. Whitney informed a Telegraph representative that the company had abandoned the idea of extending their ditch any farther up the river, as they intend to turn their hydraulic mine into a drift mine, as a more convenient mode of getting at the pay gravel where the bank is so very high. This is the mine in which millionaire H. H. Warner of Rochester, N. Y., is interested.

RICH PAX.—The Bellerat mine is working day and night, and has very good indications of finding rich pay on the bedrock. The amount of water which they have to contend with is phenomenal, and it is necessary to keep the pump going almost constantly. Power for pumping purposes is furnished by a large threshing engine. There has been an immense amount of work done on this mine, and the

shaft is now down to a depth exceeding 80 feet from the surface. An important discovery was recently made at the Spencer mine on Humboldt. A 3-foot ledge, carrying free gold, was discovered in one of the lower levels of the old shaft, and at a depth of 240 feet. This new vein is said to be exceedingly rich.

Sonoma.

LEOPARD.—Healdsburg Tribune, April 30: Work at the Leopard mine, situated 18 miles west of Healdsburg, is progressing very rapidly. The tunnel which is being bored already reaches a depth of 175 feet, and the rich ledge of gold and silver ore is expected to be struck at any time. As soon as the vein is reached a 10-stamp mill, smelter, etc., will be expected, and the mine will be operated with heavy forces. The owners are well pleased with the prospects and believe they will strike it rich.

Tuolumne.

WORKING GRAVEL.—Sonoma Independent, April 30: A. R. Vining of Oakland, who leased the Peoria gravel mine at Mountain Pass, intends to work the same by means of a recently patented machine for the treatment of auriferous gravel. It will handle, it is said, about 3000 cubic yards per diem, and save every microscopic portion of the finest flour gold, as the gold is passed through quicksilver 400 times under pressure. The gravel is fed to the machine by a powerful steel shovel. The plant is said to cost about \$50,000.

Ventura.

IN THE OIL FIELDS.—Ventura Free Press, April 30: The increasing activity in oil matters in this county leads to the belief with many that the industry will soon exceed in value all other products in the county. Hitherto the wells have principally been confined to a section above Santa Paula, but lately considerable stir has been made in the vicinity of Nordhoff on the Ojai. Eventually, oil will be found in many places on the Ojai and its tributary canyons, and possibly may lead to direct benefits to this city in the way of repositories and refineries being built. A great many people venture the opinion that oil will be found well down the canyon, or within three or four miles of Ventura. Every barrel of oil taken out is just that much revenue to the county.

EXTENSIVE OIL WORK.—The Union Oil Co. has completed the third successful well on the Frank Robertson hill at Bardsdale, the flow being about 40 barrels per day. At least two more wells will be sunk on the hill, and then they will move down into the valley and drill. An extensive pumping station is being constructed from which all the hill wells will be pumped. It is reported another company is on the field, and leasing for oil and mining purposes is lively. Mrs. Randolph and William Horton leased their lands this week.

NEW OIL WELLS.—From H. A. Clayton it is learned that a Los Angeles company has leased his land, close to Nordhoff, for oil purposes. Four wells will be sunk at once. There is favorable prospect for a good flow of oil on the land.

ANOTHER BIG OIL STRIKE.—Fillmore is in luck again. On Saturday a 60 barrel a day well was struck on Frank Robinson's place next to Brice Grimes. The depth was 415 feet, and it took but 12 days to put the well down.

NEVADA.

Washoe District.

CON. CAL. AND VA. MINE.—1100 level.—From the end of the drift running south from the top of the upraise, 73 feet above the sill floor, which was carried up from the mouth of the west crosscut No. 3 from the main south drift, 310 feet south from the shaft station, the west crosscut has been extended 23 feet; total length, 43 feet, continuing in vein porphyry, with fine lines of quartz of low assay value. 1500 level.—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. From the upraise which was carried up from the end of the crosscut run west 36 feet in from the main south drift, 155 feet south from the shaft station, we have continued to work upward and to extract ore of fair quality. 1600 level.—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore has been extracted. 1650 level.—Have completed repairs to upraise carried up 59 feet above the southwest drift, and are prospecting west from the upraise 35 feet above the sill floor. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. From the north end of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality. 1750 level.—In east crosscuts No. 1 and No. 3 from the main south drift have continued to extract some milling ore. 1800 level.—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level we have continued to extract ore, from the sill floor upward, of milling value. From the drift run north from the same east crosscut, at a point 60 feet north from that crosscut, are putting in square set of timbers and extracting some milling ore therefrom. There have been extracted from all parts of the mine during the week 1284 1600-2000 tons of ore, which were shipped to the Eureka mill. The average assay value of the ore worked at the Eureka mill during the week, 1525 tons, was \$10.10; bullion shipped to the Carson Mint, assay value, \$18,445.15.

OPHR.—1465 level.—From the mouth of the north drift, from the drift run west from the winze 122 feet below the sill floor of the 1300 level, have continued our work in an easterly direction and extracted some ore therefrom. There have been raised to the surface during the week 26 tons of ore, the average assay value of which is \$22.50 per ton.

HALE & NORCROSS.—On the 900 level upraise

above this level, on our north line, extended five feet and connected with the Savage ore stopes. Have started to stope ore south of our north line above and below the point of connection. Winze from this level near our north line is sunk 15 feet; bottom in quartz, clay and porphyry. Hoisted 93 cars of ore from this level for the week. 1100 level—Are extracting ore from above and below this level. The stopes continue about the same as at last report. East crosscut on this level advanced 35 feet, through porphyry showing streaks of quartz. The quartz in fact to-day yields low assays. From this level, hoisted 184 cars of ore during the week. 1450 level—This stope yielded 75 cars of ore during the week. Have men on repairs where needed in the mine, and are doing some prospecting. Shipped to Brunswick mill during the week 433 1440-2000 tons of ore. Average of railroad car samples, \$19.49 per ton. Average of battery assay for the week, \$14.71 per ton.

MEXICAN.—On the 1465 level from the south drift from the crosscut running east from the bottom of the winze at a point 77 feet in, a west crosscut has been started and advanced 29 feet in quartz formation showing an average assay value of \$6 per ton. The face of the crosscut is showing a mixture of porphyry and quartz.

UTAH.—The west drift from the shaft station, 340 level, has been extended a total length of 602 feet. At this point passed through little quartz and clay and cut into west country rock. From the west crosscut, at a point 595 feet from the shaft, a north drift has been started and advanced 20 feet in vein porphyry formation.

SIERRA NAYADA.—The joint Sierra Nevada and Union west drift from the shaft, 900 level, is extended during the week 32 feet, making its total distance west of shaft 1900 feet; face in clay and porphyry. The Union east crosscut near south line from south lateral drift, 1570 feet west of shaft, 900 level, has been advanced 16 feet, making a total distance of 81 feet; face in porphyry.

BULLION.—The east crosscut, 350 feet south of north line, 1300 level, is out 107 feet; last 54 feet in quartz that give low assays.

CON. NEW YORK.—The north drift from the raise above 650 level is out 58 feet; face in quartz, some of which yields low assays.

ALPHA.—During the week have been retimbering the joint southwest drift from the 1800 level of the Ward shaft.

EXOHUECA.—During the week have been retimbering the joint southwest drift from the 1800 level of the Ward shaft.

SILVER HILL.—The north drift from the Justice shaft, 490 level, is out 600 feet; face in gypsum and quartz.

BEST ANN BELCHER.—900 level—East crosscut No. 1 has been advanced 20 feet; total length, 104 feet; face in porphyry. West crosscut No. 1 has been advanced 16 feet through porphyry; total length, 24 feet.

GOULD & CURRY.—200 level—Northwest drift, 435 feet west of shaft, has been advanced 20 feet; total length, 234 feet; face in porphyry. 400 level—At a point in northwest drift from west crosscut No. 1 started an east crosscut in quartz, clay and porphyry, and extended same 15 feet. Also did considerable repairing on the 309 and 400 levels. On the Sutor tunnel level the joint north drift with the Savage Company was advanced 25 feet; total length, 404 feet.

OCCIDENTAL.—The west crosscut from the south drift, 400 level, is in 84 feet, still showing stringers of pay ore. Have started to drift north on one of the seams showing in same crosscut. Have extracted about 40 tons of good ore from the drift started north from bottom of winze on 450 level. The drift started south from west crosscut on 550 level is in 14 feet, showing bunches of pay ore. West crosscut No. 2 on 750 level is in 25 feet; face in low-grade quartz.

ANNES.—On the 420 level west crosscut No. 1 from north drift on east side of the ledge advanced 7 feet and stopped in hard porphyry. From this west crosscut a north drift has been started 80 feet from the face and extended during the week 12 feet; formation, porphyry. West crosscut No. 3 from north drift on east side of the ledge advanced 12 feet; face in quartz and porphyry. Eased timbers in main north drift and repaired drain.

POROSI.—The winze is down 215 feet h-low the 1500 level; bottom in quartz which gives low assays. Potosi and Bullion west crosscut on south line, 1500 level, is out 162 feet; face in porphyry. Extracted and sent to mill in the past week 372 600-2000 tons of ore from the 930, 1100, 1150 and 1200 levels. Milled during the week 405 tons; on hand at mill, 100 500-2000 tons; average battery assay, \$21.82. Are repairing the joint northwest drift from the 1800 level of the Ward shaft.

CEOLLAR.—Are repairing on the 450 and 750 levels. The east crosscut on 1610 level, 150 feet south of north line, is out 84 feet; face in porphyry. Have resumed work in the south drift, on 640 level, which is now in 166 feet; face in soft porphyry.

Tuscarora District.

NAVAJO.—*Times-Review*, April 29: North drift, 350-foot level, extended four feet and a stope started above the level. No change elsewhere.

BELLE ISLE.—North drift, 350-foot level, extended seven feet, showing some very nice ore. West crosscut, same level, extended 14 feet.

NORTH BELLE ISLE.—No. 1 north drift, 400 foot level south, extended 34 feet, looking very favorable for ore. West crosscut, same level, extended seven feet. South intermediate from No. 1 upraise, south 500, has been extended 25 feet and stope started. Hoisted 46 cars second-class ore.

NEVADA QUEEN.—Second level—No. 1 south drift extended 25 feet, and No. 3 east crosscut 22 feet, leaving 27 feet yet to run. Will make

the connection by the 1st. The raises are all connected on ore, and work suspended on account of ventilation until connection is made on the level; then will start extraction of ore. Third level—East drift from No. 3 raise extended 21 feet; face of drift does not look so well; ore is low grade. South gangway from No. 3 raise extended 20 feet, exposing some high-grade ore. Gangway from No. 2 raise advanced 22 feet. Stopes produced for the week 12 tons first class, assay value \$309 per ton, and 78 cars second class, average \$12 per ton.

Ferguson District.

HIGH-GRADE ORE.—*Pioche Record*, April 28: While the people generally are losing some of that feverish excitement over Ferguson old discoveries, there is taking its place that firm and confident feeling about the district which is usually characterized by a strong intent of purpose that always musters the latent energies to a lively struggle "to be in it" when the opportunity of perhaps a lifetime presents itself. Men who come back from Ferguson now are all in a hurry, and as soon as they get such supplies as will enable them to pursue systematic prospecting and developing, they are off again. Every one who comes from the new district gives an encouraging account of it, and all predict for it a great future. Among the latest arrivals from Ferguson is Mr. S. T. Godbe. Knowing that Mr. Godbe's judgment is held in high esteem on all mining matters, he was sought by an attaché of the *Record* and asked to relate what he thought of the camp in general, to which he replied: "Ferguson is all right. I have seen a good many camps that have been blown up a great deal, and when you went to them, you didn't find what you expected to find, and would come away disappointed; but here in Ferguson I was agreeably surprised, and that is saying considerable. I have been nearly all over the district, and seen all the best prospects. In the April Fool mine they have run a cut about 12 or 15 feet below the first outcrop, which proved a vein at that point of 55 inches in width, carrying over \$1100 in gold, besides the silver. A fair average of the vein will go pretty well in silver, because there is four inches included in the 55 inches that assays 10,000 ounces silver to the ton. Besides the vein itself, they have three or four inches on the hanging-wall that samples \$24,000 in gold. There are three or four feet of soft picking ore in the vein, and in each wall of the ledge there are three or four inches of the quartzite that is literally spattered with gold and richer than the vein matter itself. Of course, this gold in the quartzite has worked in from the fissure. The walls are more or less impregnated with gold for 15 or 25 feet, but it would not be proper to include all that in the width of the vein, because the ledge is comparatively a narrow fissure with its dips, spurs and angles going off into the walls quite a distance. When its owners get fixed for handling low-grade ore, there may be 20 feet of the wall that will pay to handle. The walls are rich in gold, and for a little way in they run up into the thousands of dollars per ton; but then, for some distance out, it would average low. The ore chutes are indicated by the open fissure is shown to be 300 feet long; beyond that the fissure is closed, and there are no signs of mineral. I don't think they can get an assay beyond where the fissure is closed. The April Fool is a fissure, cutting the bed of the country at right angles to the dip, just like the fissures are here in Pioche. They are fissures breaking from one porphyry dyke to another porphyry dyke, although the dykes are in quartzite.

"The Magnolia is the same character of vein. There is now on this ledge a shaft of 25 feet, and the vein has improved regularly as far as it goes down. Messrs. Cohn & Wilson own a claim called the Ferosa that they think is going to turn out big. It is a huge ledge 50 feet wide, and they say it will assay about \$50 in gold per ton. Ferguson district cannot fail to turn out to be a good mining country. I never heard of a vein so pretty as the April Fool, or quite so rich. Of course, it would take a thousand men a year or two to prospect that district, for it is a big mineral belt, and it is covered so much with boulders and soil that prospecting will naturally be slow and tedious. The veins are all on a contact with porphyry and quartzite like the Yuba and Ontario mines, and if they don't go down, then there is no use relying on indications, and there is nothing in the generally accepted principles concerning permanent veins."

Kennedy District.

SOME OF THE CLAIMS.—*Cor. Silver State*, April 29: Spent one day and night at the new camp and visited some of the claims. Charles Kennedy is at work on the Imperial mine, and has run a tunnel 65 feet, incline down 40 feet, and the ore assays from \$20 to \$300 per ton in gold and silver; width of ledge, from 2 to 4 feet. The Cricket mine has a tunnel in 150 feet, and the ore assays from \$30 to \$250 in gold and silver; width of ledge, from 6 inches to 2½ feet. Mr. Kennedy has located placer ground, found color and good indications for placer mines. He has an arrastre just started up which does good work. It is 18 feet in diameter, and crushes about a ton each day. The next location investigated belongs to Lamberson and Northway, and is called Old Kentucky. This is an old claim that was worked in '66 for cinabar. The ore assays 70 ounces in silver, and gold from a trace up to \$60; tunnel 40 feet; width of ledge, 3½ feet. They also are prospecting for placers. J. D. Herley's Pride of the Mountain has an incline down 30 feet; ledge, 6 inches to 3 feet wide, which assays from \$10 to \$150 in gold and silver. Next is Joe Miller's claim, Chipmunk. It has a tunnel run in 90 feet and an incline 30 feet; width of ledge, 4 inches to 1 foot; assays as high as \$150. Kyla and Hillyer have a prospect shaft 40 feet deep; ledge, 6 inches to 2 feet; assay away up. Jake Leick's Bismark has an incline down 75 feet;

ledge, 4 inches to 1 foot; assays from \$10 to \$130. Bent Larson calls his prospect the Accident; tunnel 80 feet; ledge, 1 foot wide, which shows fine bunches of galena. Stone and Wiggins have four claims—the Kersege, Wiggins, Alta and Alice. They assay from \$50 to \$100 in gold; ledges from 14 inches to 4 feet; tunnel 175 feet on the Kersege, and shows good ore all the way through; tunnel about 100 feet on the Alice and 60 feet on the Alta. Daniel Keeler and the Towle Bros., who own the Wall Street, have a tunnel run in 40 feet; assays from \$30 to \$150 in silver and gold. Next is the Enreka, on which there has not been much work done; assays from \$50 to \$100. The C. E. Towle mine has been developed but little, and the ore assays between \$50 and \$100. The T. Towle has an incline down 6 or 7 feet, and assays about the same as the others. Little Johnnie—Not much done; assays about the same. There are altogether about 50 locations made in the camp, many of which I did not see nor get any information on. J. A. Blossom of Battla Mountain was there taking in the camp. He is interested in several good claims, and intends shipping a carload of ore soon. If the returns are satisfactory, he will build a mill there this summer. Keeney is situated in a nice level canyon. The hills are not very high and are smooth, and wagon roads can be made almost anywhere for the purpose of getting down ore. The ground is soft and easily worked, plenty of good timber close by, juniper and pine, and an abundance of good mountain water—a fine place for a town and mill.

ARIZONA.

LYNX CREEK HYDRAULICS.—*Prescott Journal-Miner*, April 30: The above hydraulics have, for the amount of water at the disposal of the management for working, been most successfully worked, and the gravel has proved to be for hydraulicking very rich, and has satisfied the people interested in the property that it is a very valuable one, and one which will be for many years to come worked to a large profit. The only drawback to the property is the scarcity of dump space, which necessitates the boxes being placed on a low grade. The boxes used this season measured inside 3 feet in the clear wide, and were 3 feet deep, but were reduced in the bottom by two 2x12 lining boards, and the grade they were run on was 3½ to the 16-foot box. Two giants were in position and kept up to the banks, and worked together when there was sufficient water. These giants were served by two 9-inch pipes, which pipes were served by a 22-inch pipe from the ditch on the east bank of the creek. The pressure obtainable from the ditch to the workings was 280 feet. It has now been definitely proved that the Lynx Creek hydraulic mines, when served by a dam on Lynx creek, will be one of the most valuable properties in Yavapai county. The Lynx Creek dam access will make irrigation in Lonesome valley profitable, and there can be little doubt but that there is a great future for the Lynx Creek Co., and provided this company be a success, it will be undoubtedly of great importance to Prescott and to Yavapai county, as it will stimulate capital to invest in the county, and capital is what this very rich country suffers from, and is certainly the only thing required to make Prescott a second Denver.

OREGON.

WILL TUNNEL.—*Engene Register*, April 30: As soon as the snow clears away sufficiently the Blue River M. Co., composed of residents of this city, will put a force at work on their claim in the Blue River mining district, and will do about 100 feet or more of tunneling to see what may be found in the way of pay rock. They now have over 300 feet of tunnels in the mountain at different places. They do not care to invest in a mill until they are sure there is a large amount of material to work on.

THE SANTIAM MINES.—*Albany Herald-Disseminator*, April 30: The Albany M. & C. Co.'s 10-stamp quartz mill in the Santiam district has again started up and is now in full blast for the season's run. The company has a large force of men at the works, and have large piles of ore out ready to be crushed. The mill, Secretary Pipe says, will now be kept running constantly day and night. It has a capacity of 25 to 30 tons in 24 hours, and from former results and present indications the company feels positive of a very successful season's work. It is predicted by many that this summer's work in the Santiam mines will fully reward the expectations of those who have invested capital in the extensive mining machinery to work them, and will prove this to be one of the richest mining districts of the Northwest.

PLACER MINES.—*Bedrock Democrat*, April 27: The present season, judging from all reports received from the many placer mining camps throughout the county, is one of the most favorable for the working of gravel diggings experienced in Baker county for many years, and it is reasonable to expect that the placer gold yield will be very large. A *Democrat* reporter stepped into the Baker City National Bank yesterday and was shown by Mr. C. W. James a considerable amount of gold just received from the old reliable camp of Chicken creek, a district that will yield many thousands of dollars if an efficient supply of water is obtained. Nuggets, beautiful specimens, weighing over an ounce, coming from Granite creek, were also displayed. On Sutton creek, Messrs. Palmer Bros. have every prospect of a handsome yield, water being plentiful. These diggings are of known richness. The placers of Sumpter and Granite will soon begin contributing largely. The Pochontas placers will also be operating extensively.

THE MINES.—*Ashland Tidings*, April 23: Wallace Rodgers and John Loftus are sinking a

shaft on the ledge recently uncovered on the hill back of the flaring mill lot in the Roper and Carter summit addition. The ledge was two feet wide at the surface. The shaft is now down about 25 feet, and the ledge has widened to three feet. The vein has every appearance of being a true fissure, and the boys are taking out some very fine looking rock. Prospects all improve in the Ashland mine on Patton ledge—drifts now about 100 feet from shaft—three feet of rock assaying from \$15 to \$48 to the ton. The wagon road will be ready for use next week. J. H. McBride is interested with E. K. Brightmen in the holding of the Coolidge and Sutton land, on which coal has been found, east of Ashland, and on Tuesday he began work with a force of several men, running a prospecting drift. The discovery of the coal croppings there was first made some years ago, it is now learned, but no prospect work has ever been done. The coal taken out burns well and does good forge work.

NEW MEXICO.

SMELTER SOLD.—*Southwest Sentinel*, April 26: The smelting plant at Pachel, in the Burnn mountains, has been sold to Nick Gales, and will be removed to Hillsborough. Work has been commenced on the smelter site at Hillsborough, and the plant will be in operation early in the summer. Placer mining will be carried on more extensively in Pinos Altos district this summer than for many years past. Of late the placer mines there have been worked mostly by Mexicans and Chinamen, and in a small way. Now the mines will be worked in a more systematic manner, and the product will be largely increased. Felix Leavick is developing the Maud S. and Link mines in the Silver Creek district, which were recently purchased by an Eastern company. The machinery for the new electrical ore reduction works at Albuquerque has been ordered, and the plant will be in operation this summer. It is claimed that refractory ores can be successfully treated by this process, and experiments have been made with ore from this county which are said to have been highly satisfactory. Ex-Governor Stover, who is one of the members of the company which will erect the works, is very enthusiastic, and is certain that the venture will be a success. If it will do what is claimed for it, a large number of mines in this Territory which produce low-grade refractory ores can be worked profitably. A large percentage of the metal in refractory ores, treated in the mills in this county, is lost in the tailings which, if saved, would very largely increase the bullion product and would make the operation of the mines now being worked much more remunerative and, in addition, make it possible to work many mines which are now idle.

WASHINGTON.

NEW DISTRICT.—*Seattle Mining News*, April 30: A gentleman from Tacoma, who has recently returned from a prospecting trip to the new district on Marshall creek, reports very favorably of the mines there. Among the most prominent are the Jesse Harbor, 40-foot ledge of free-milling quartz, assaying \$48 gold; the Grizzly, 9-foot ledge, and the Mountain Queen, 8-foot ledge, and only one wall yet found. All the ledges are free-milling and though the ore is low grade, the quantity and accessibility will doubtless make this one of the prominent districts soon. There has been no snow of any consequence all winter, and the only drawback to prospecting is the dense growth of timber and vegetation. The mines are located 30 miles southeast of Tacoma.

THE RESERVATION.—Word comes from Colville that the people of Stevens county, tired of the slow progress of Congress in the matter of opening the Indian reservation to settlement, have held meetings to consider the question, and the impression is that the Indians have no valid title to land; that they are only tenants by sufferance, and that the restoration of the land to the public domain is simply a matter to be determined by voluntary appropriation. It is estimated that there will be 2000 people from the adjoining country on the reservation within ten days. It is known to be rich in gold, silver and coal, as well as timber and agricultural lands. Miners are preparing to go in on every hand.

STILLAGUAMISH.—Work has been pushed all winter by the Stillaguamish Hydraulic M. Co. Morrison & Co. have increased the force on the Hoodoo, and will soon begin on the Silver Boda. The Lulu, one of the first discoveries in this district, and on which some development work was done last season, will be opened up this summer. The Malody Bros are erecting building and getting in shape. The Anacortes is opened up sufficiently to have a steady shipper, and has considerable good ore on the dump awaiting transportation. They have been working all winter and will increase the force immediately.

SILVER CREEK.—The Silver Slipper and Four Brothers claims in Silver Creek district, were sold last week for \$6000. Prospectors and mining men are arriving in Galena daily, and notwithstanding the backwardness of the season, they are pushing in with the determination to go to work any way.

SWAKE MINES.—*Cor. Ellensburgh Capital*, April 23: Mining news is very scarce, the weather being so bad that everything is at a standstill. The hydraulic mines are running full blast and the rain just suits them. There is some little stir in quartz. W. A. Ford, T. W. Smith and W. H. Kaup have two capitalists negotiating for the Buck Horn mine. Ford & Co. ask \$15,000 for three claims and are willing to take more, but no less. Tweet, Johnson & York will commence grinding quartz with their new arrastra next week.

MECHANICAL PROGRESS.

Boiler Tests.

Mr. Geo. H. Barrus, of Boston, has written a treatise on boiler tests, embracing the results of 137 evaporative tests made on seventy-one boilers, conducted by the author. In summing up the general conditions which secure economy in using coal, says the *American Manufacturer*, he shows that the highest results are produced where the temperature of the escaping gases is the least. In other words, the greater the amount of heat which is absorbed by the heating surfaces and the water in the boiler before the heat escapes up the chimney, the greater the economy, which ought to be very obvious, but which is often overlooked. The temperature of the escaping gases which will produce the best results, the author concludes, will be about 375° for anthracite and 415° for Cumberland (bituminous) coal.

The relation between the heating surface and the grate area which will produce the highest efficiency is also considered. The conclusion is that for anthracite coal it should be in the proportion of 36 to 1, and that either more or less produces a loss, when the rate of combustion does not exceed 12 pounds of fuel per square foot of grate per hour. For bituminous coal the ratio should be from 45 or 50 to 1, and the conclusion is drawn that a "much larger amount of heating surface is required for obtaining the full efficiency of bituminous coal than for boilers using anthracite coal."

Another interesting conclusion deduced from the experiments is "that a certain minimum amount of tube opening is required for efficient work." The highest efficiency, he concludes, with anthracite coal is obtained when the tube opening is from one-ninth to one-tenth of the grate service. For bituminous coal he concludes that the area of the tube opening should be from one-sixth to one-seventh of the grate service.

A comparison is then made of the economy of different kinds of boilers, which is very interesting; but there is room here to give only the writer's conclusions. The form of horizontal boiler, he says, which with suitable proportions and operation can be depended upon to give the highest evaporation is the common horizontal return tubular boiler so widely used in New England factories.

"The general conclusion," he says, "to be drawn from all these comparisons is that the economy with which different types of boilers operate depends much more upon their proportions and the conditions under which they work than upon their type; and, moreover, that when these proportions are suitably carried out, and when conditions are favorable, the various types of boilers give substantially the same economic result."

A separate section is devoted to a comparison of the value of different kinds of coal, the general results of which are given in the following table:

Name of Coal.	Pounds of water evaporated from and at 212 degrees per pound of dry coal.
Anthracite, broken.....	9.79
"Cumberland," bituminous.....	11.04
Anthracite, chestnut.....	9.40
"Pea".....	8.86
Two parts pea and dust and one part Cumberland.....	9.38
Two parts pea and dust and one part culm.....	9.01
Nova Scotia culm.....	8.42

Some tests were also made to determine the value of petroleum as a fuel, the conclusions from which the author sums up as follows: "This means, in round numbers, that the price of oil must be less than one dollar per barrel, delivered at the boiler, in order that the cost of fuel and labor for a 1,000 h. p. plant shall be equal to that which obtains when Cumberland coal is used at \$4.56 per ton."

To Facilitate Lathe Work.

A Providence (R. I.) man has invented a device for facilitating the performance of lathe machine work. The apparatus, says the *Manufacturers' Gazette*, consists of a bearing block with a base plate to be fitted on the gibbed ways of the tool carriage of a lathe usually occupied by the tool post, the place of which it takes. The block is made a bearing to receive the journal of a vertically revolving tool holder, which has the parts named. A circular head is held by a horizontal journal on its back in a bearing in the block. Its face contains four radial channels at right angles to each other, but the number of these channels may be more or less, according to the size of the head.

These channels are adapted to hold tools similar to those in use for turning, milling and working on metal in a lathe. Setscrews

fitting in cavities made in the head between the channels hold the lathe, the screw being fitted to screw through the flange between the cavity and the channel, and bearing in the tool, hold it firmly against the opposite side of the channel. The open channels to receive the tools is one of the improvements over the mortises specified in a previous patent, as the channel gives greater facilities for setting the tools, allows them to be turned to one side if required, and a thicker or a crooked tool can be easily held. The automatic operation of the stop bar is another improvement, inasmuch as when the head is turned to bring up another tool toward the work, the projection that holds the leveling screw will push back the bar itself, obviating the use of a hand lever.

This is done by pivoting the bar at its back end in the slot so that its front end will easily swing out when the projection comes up against it, and allow the projection to pass, the bar being drawn in back under it by a light spring. There is also an arrangement by which the bar can be pushed out from the front, if desired, by pressing on a boss which is connected by a small rod pivoted to the bar and screwed into a hole in the boss at the other end. The spring is held on this rod so as to bear at one end on the boss and the other end against a shoulder of the recess that holds it. There are projections or lugs through which the leveling screws are tapped so as to bring the heads on the top, where they can be easily adjusted to set the tool exactly right at once, instead of going through an unnecessary lot of turning and guessing, all of which entail a certain loss of time with less satisfactory results.

The journal that the head turns on does not extend way through the block, but the bearing is bored nearly through, and a hole is made in the center to receive a tightening bolt that extends through the head and journal out through this hole, and has a screw-nut fitted on its end, which, by means of a wrench, draws the bolt in and holds the head firmly to the block.

As the tools are necessarily short and difficult to handle by a blacksmith in making or repairing, a cutting part is provided on each end, so that when worn out at one end it can be reversed and used as much longer.

Aluminium Soldering.

The following methods of soldering aluminium are recommended by the Neuhausen Company, and published in the *Scientific American*. For sheet aluminium an iron solder may be used with a flux composed of resin, neutral chloride of zinc, and grease. The metal should not be cleaned or scraped unless it is absolutely necessary to do so, in which case alcohol or essence of turpentine should be used for the purpose. For five per cent aluminium bronze tin solder may be employed, but this is not possible with the 10 per cent alloy, in which case the company recommends a preliminary copper plating. If it is difficult to dip the ends to be plated directly into the solution, pieces of blotting paper soaked in a solution of CuSO₄ may be laid on them and a current passed. The flux mentioned above may be used.

Another solder which is recommended is one consisting of copper 56 parts, zinc 46 parts, and tin two parts, applied with borax. Some tests made at Neuhausen showed that with these solders plates of aluminium soldered together, edge to edge, required a tractive effort of from 16½ to 18 tons per square inch to pull them asunder; if the edges overlapped, 22½ tons per square inch were required. Pieces of cast aluminium bronze, if placed in sand moulds, can be joined together autogenously by running in some of the molten metal. If this operation is properly carried out, the joint is indistinguishable from the rest of the casting. Thin cylinders of aluminium are made in this way by bending the sheets round end to end, and soldering with molten aluminium.

ENGINEERS' TEST FOR IRON.—At the meeting of the Liverpool Engineering Society, held recently, Mr. Thomas Morrison read a paper on "Engineers' Tests for Iron Considered, and Suggestions for Standard Uniform Tests." The author showed by tables of numerous engineers' tests how engineers would ask for different tensile strains for some class of work, adding that the iron must be equal to some known "brand," as though the iron produced in the localities named were uniform in quality. He paid a high tribute to the reduction of area test, as being one that gave more consolation to the engineer in case of work coming to grief than any other test specified. The elongation test, which he said was only another form of test for ductility, was not to be depended upon with the same ease and comfort as contraction of area; and the manner

in which the former test was specified by nearly all engineers was anything but creditable. He treated the limit of elasticity test with disfavor. His suggestions for standard uniform tests and conditions were put in the simplest form, and were thoroughly explained to those present.

SCIENTIFIC PROGRESS.

Schools of Science.

The State University at Berkeley announces its intention of repeating the courses of instruction in chemistry offered to the general public during the summer of last year under the denomination of "summer school," and also of offering for the first time a summer school of biology. The school of last year, though very little advertised, was well attended and successful. The authorities wish to make it known to more people this year that all those interested in the science may avail themselves of the opportunity to study it. The chemical laboratories have just been completed and equipped in such a way as to offer as good facilities for chemical work as can be found.

The characteristic features of the course will be the opportunity for practical work in the laboratory. Each person taking part in the course will have a desk and the necessary reagents and apparatus at his disposal and will receive such personal assistance and guidance as may be necessary. The course is intended primarily for the teachers of the State, especially for those who wish to prepare themselves as teachers of chemistry. Special attention will be given to points connected with the successful conducting of experiments before classes and to the precautions to be observed. In a word, it is intended to make this a training-school for teachers. Applicants are requested to state their preparation, whether elementary or advanced. Advanced students, who do not require such direct and personal supervision, will be allowed to carry on such lines of advanced work as may be agreed upon. Certificates of proficiency will be given to those members of the class who distinguish themselves by their daily work and who pass a satisfactory examination at the close of the term. This examination is not required, save from those who wish certificates.

No tuition will be charged, as all the University courses are free, but a deposit of \$10 will be required, \$5 of which will be retained for the chemicals used. The cost of the apparatus that may be broken will be deducted from the remainder and the surplus will be refunded to the student. The session will begin on Wednesday, June 22d, and will be under the personal supervision of Professor E. C. O'Neill, one of the most popular instructors at Berkeley.

The summer school of biology will be of a slightly different character. Professor Ritter, who is now in charge of the department of biology, wishes to accomplish some permanent results in contributions to science. To that end he intends to devote the work of his summer school to marine biology. The ocean along the California coast contains many varieties of marine life that are to be found in no other region accessible to scientists, and it is very important to the science of evolution that these varieties should be thoroughly worked up. No one has ever undertaken the work and Professor Ritter wishes to gather a number of earnest students to assist him in beginning it this summer. Adolph Sutro has offered the use of his new and splendid aquaria at the ocean beach in San Francisco to Mr. Ritter, which will make it possible to preserve and study the organisms as they live and move in their own element. Elaborate collections will be made from Monterey and, possibly, Santa Barbara bay, and transferred to Mr. Sutro's aquaria. The work will begin some time in July. Further announcements will be made next month. Meantime inquiries should be directed to Professor W. E. Ritter, Berkeley.

THE GULCHER AND PINTSCH THERMOPILE.—Twelve or more blocks of copper are arranged radially round a center, forming a tube, through which the flame of a Bunsen burner passes. To the back of each of these pieces of copper (which are insulated from each other) are connected the ends of plates of antimony-zinc alloy and nickel; the former being cast onto the copper, and the latter brazed. The outer end of the nickel is connected to the outer end of the antimony of the next couple, and so on round the ring; the series being—Cold Sb-Ni, hot Ni-Cu, hot Cu-Sb, cold Sb-Ni, etc. Large copper plates are attached to the cold junctions to facilitate radiation. Several of the

rings thus built up are placed one over the other, separated by asbestos, which is the insulating material used through the tube thus formed. The whole is in an outer case, through which a draught of air is induced by joining it to the outlet of the central into the chimney.—La Lumiere Electrique.

Theory of Thunderstorms.

Solids and liquids cannot be charged throughout their substance with static electricity; if charged at all, the electricity is upon their surface. But gases and vapors being composed of myriads of separate particles, can receive a bodily charge. The air in a room in which an electric machine is worked is found afterwards to be charged. The clouds are usually charged more or less with electricity, derived probably from evaporation going on at the earth's surface. The minute particles of water floating in the air being better conductors than the air itself become more highly charged. As they fall by gravitation and unite, the strength of their charges increases. Suppose eight small drops to join into one. That one will have eight times the quantity of electricity distributed over the surface of a single sphere of twice the radius of the original drops; and its electrical potential will therefore be four times as great. Now a mass of cloud may consist of such charged spheroids, and its potential may gradually rise, therefore, by the coalescence of the drops, and the electrification at the lower surface of the cloud will become greater and greater, the surface of the earth beneath acting as a condensing plate and becoming inductively charged with the opposite kind of electrification. Presently the difference of potential becomes so great that the intervening strata of air give way under the strain, and a disruptive discharge takes place at the point where the air offers least resistance. This lightning spark, which may be more than a mile in length, discharges only the electricity that has been accumulated at the surface of the cloud, and the other parts of the cloud will now react upon the discharged portion, producing internal attractions and internal discharges. The internal actions thus set up will account for the usual appearance of a thunder cloud, that it is a well-defined, flat-bottomed mass or cloud which appears at the top to be boiling or heaving up with continual movements. Electrical Age.

ALUMINIUM.—Mr. J. H. Dagger, in a paper read before the Liverpool Section of the Society of Chemical Industry, says that aluminium can never possibly take the place of steel and iron for structural purposes, such as bridges and heavy machinery; it is not a rigid metal, and its elasticity is low; though it is only one-third the weight of iron it has less than one-half the tensile strength of the best wrought iron, and one-third that of mild steel. But it is the lightest of all industrial metals, and this lightness is combined with a tensile strength not far below gun-metal when it is rolled or drawn, and equal to cast iron in castings. It is an excellent conductor of electricity, its melting point, 700° C., is between that of zinc, 433° C., and copper, 1082, its high specific heat making it most valuable of all metals for fine castings and light machine work, and with this corrosion resistance only inferior to the noble metals. Aluminium, surely, with these properties, needs no special pleading.

ELECTRIC OSMOSE.—Porret observed, says the *Electrical Age*, that if a strong current is led into certain liquids, as if to electrolyze them, a porous partition being placed between the electrodes, the current mechanically carries part of the liquid through the porous diaphragm, so that the liquid is forced up to a higher level on one side than on the other. This phenomenon, known as electric osmose, is manifest when badly conducting liquids, such as alcohol and bisulphide of carbon are used. The transfer through the diaphragm takes place in the direction of the current; that is to say, the liquid is higher about the cathode than round the anode.

ELECTROLYTIC SEPARATION OF MERCURY FROM COPPER.—Messrs. E. F. Smith and A. W. McCauley, in the course of an article, state that this separation was attempted previously, but was not complete unless the amount of copper present in solution did not amount to more than 20 per cent. of the mercury present in solution. It has now been ascertained that, by careful regulation of current, it is not only possible to separate the two metals, when present in equal quantities, but also even when there is twice as much copper present as mercury.

ELECTRICITY.

Electricity in Mining Operations.

In the *Electrical World* of March 5th the subject of power transmission was treated by Mr. Schlesinger from the standpoint of the man who owns the plant and rents his power to the consumer. This method of treatment gave a set of very interesting curves showing the cost of power transmitted at various voltages and for different distances at a constant voltage. Looking at the problem from this standpoint, it was pointed out that the question to be considered is not so much that of making the cost per horse power delivered by the motor a minimum, as it is one of making the net profits derived from each horse power available at the generating plant a maximum. In this consideration, the fact that the conditions of minimum cost of operation do not necessarily give the most efficient plant plays an important part. In a recent paper by Mr. Irving Hale, this subject is discussed in the most comprehensive way with the view of pointing out the present limitations of electric power in its application to mining operations. Mr. Hale has taken a very conservative view of the situation. His aim has been to point out the fact that there are at present certain well-defined and easily ascertained limitations beyond which the use of electric power in mining operations would prove uneconomical and therefore undesirable, and he has in his very exhaustive study shown that these limitations are under the specified conditions. This does not mean, however, that he takes a pessimistic view of the applications of electricity to mining operations, as he points out that there is at the present time a wide and profitable field in this direction, and that the next few years will see numerous developments in this branch of electrical engineering. It is expected that certain improvements in present methods of transmission will gradually extend the limits which now define the economical use of electricity for this class of work.

But Mr. Hale indicates that there are certain well-defined secondary limits, to pass which some very radical changes in the whole method and apparatus employed will be necessary. He is an ardent advocate of the direct method of transmission of power as distinguished from the method of double conversion. He does not deny, however, that the three-phase system may render practicable transmission to distances far beyond what may be obtained by continuous currents, provided the price of coal is high enough to give sufficient margin to pay interest on the cost. A single instance which he cites is that a double conversion plant using 6000 volts in the primary costs less than a direct transmission plant using 220 volts when the distance is greater than 8700 feet, and less than a 440-volt direct plant when the distance is greater than 17,600 feet. In this, as in other cases, however, the comparative efficiencies of the two systems must be taken into consideration when determining which plant should be used. Here the total efficiency of the double conversion plant at 17,600 feet is given as 44 per cent, and the efficiency of the direct plant 55.4 per cent. In considering such problems as this, it is at once evident that the local conditions must be carefully taken into account, for in the case just cited the low efficiency of the double conversion system would have little weight provided there was an abundant supply of water power which would otherwise be unused. Up to the present time the use of electricity in mining operations has been far below that which it may be expected to reach in the near future, since many of the large electric companies have for the last two or three years been so completely occupied in developing the electric railway that they have had very little time or energy to give to the very important field of electric mining.

HOME-MADE ELECTRICITY.—A French chemist, who has given considerable attention to the problem of heating and lighting from a single source, has devised a novel stove, says *Iron*, which in appearance resembles an ordinary heating-stove. It is so arranged internally that the waste heat is utilized for the generation of electricity. This object is attained by the presence of a number of rectangular boxes of sheet iron, containing the necessary metallic elements for furnishing the current. These elements are insulated by asbestos, and the cooling is effected partly by the shape in which the metallic alloys are cast and partly by the circulation of air. The current obtained is not great in quantity, but the result of the attempt appears to be favorable. Accumulators are used for storing the electricity, and as heat is required for a much

longer period than light, the electrical energy which would be lost during the hours of daylight is saved. A point of considerable moment is that the heat utilized in this way is waste heat, so that any portion which can be recovered in the form of electricity is so much gain.

Electricity in Agriculture.

The recently awakened interest of the more advanced section of the farming community in the subject of the utilization of electricity in agriculture, lately alluded to in the *Western Electrician*, was exemplified by the action of the United States Senate when, on motion of Senator Peffer, a resolution was adopted requesting the Secretary of State to obtain from our consuls abroad information as to the application of electricity to the propulsion of farm machinery and to the propagation and growth of plants. The Kansas senator explained that it was understood that electricity had been applied in Italy to the compression of hay and also that electrical influences had been successfully used in the vicinity of Paris in the propagation of cabbages, and there was a desire on the part of the farmers to obtain definite information on these subjects. Much valuable information can doubtless be collected in this manner, as many scientists, and practical agriculturists both at home and abroad, are now studying this problem. The publication of the consuls' replies will be awaited with interest.

That there is a growing demand for information of this sort is shown by the fact that in many sections of the country experiments are being conducted on this line. A press dispatch from Auburn, Ala., announces that on April 16th, cotton was ginned by electricity for the first time in the history of the world at the Agricultural and Mechanical College of Alabama. The class in electrical engineering, under the direction of A. F. McKissick, connected the generator at the dynamo room of the college with the motor at the Statum farm about 3,000 feet away, and the motor at the farm did the work of a ten horse power engine formerly used, grinding corn for cow feed and ginning cotton.

Of course as far as the electrical engineer is concerned the application of a motor to a cotton gin or any other piece of farm machinery is no startling departure. Such experiments and new adaptations as the one just referred to, however, do an immense amount of good indirectly in that they serve to bring electric power to the notice of the agriculturist. We must reiterate our conviction that an experimental station such as Senator Peffer of Kansas proposes would do an immense amount of good by educating farmers in the many advantages of electric power.

WATER POWER FOR GENERATING.—The wide awake Manager of the Walla Walla (Wash.) Gas and Electric Company has convinced the proprietors that water power sufficient for the purpose of operating the company's electric station can be obtained from Mill Creek, which watercourse is about four miles above the city. According to information in the *American Gas Light Journal*, the water will be conveyed through wooden mains, 42 or 48 inches in diameter, for about a mile, or to the site where it is proposed to locate the water wheels and additional electric generating machinery, from whence the current will be led, by means of a naked copper wire, strung on 40 feet poles, to the old power house, where a T-H. motor will receive the current for the purpose of driving the dynamos, at present moved by steam, that supply the currents to the lamps in use in the city. Mr. Burrows estimates that about 275 horse power can be relied on, and he puts the probable cost of the installation at \$50,000.

UNDERGROUND WIRES.—The *Chicago Journal of Commerce* says that after several weeks of preliminary running, the North Chicago Street railway has put in regular operation its underground electric system on Webster and Fullerton avenues. Two motors are employed to haul the trailers around the loop, making connection with the Lincoln avenue trains. The system in use is controlled by the Love Electric Traction Company, and in operation it is much the same in appearance as a cable line. The wire which furnishes current for the motor is carried in an underground conduit with slot rail very much the same as on the cable lines. The conduit, however, is much shallower, and there is less expense in building, as the heavy yokes are replaced by much lighter ones. The wires are strung on nonconductors, and the trolley, which takes up the power, runs in the slot, as a cable's grip.

WELDING STREET RAILS.—The electric welding of street railway rails as a substi-

tute for fish plates has been the subject of experiment for some time at the works of Johnson Rail Company, Johnstown, Pa. The *Electrical Review* says the experiments are now said to be entirely successful, and it is possible to weld by electricity two pieces of steel of 25 square inches section, and a solid steel rail, three or four miles long, can be had if required. The tests also are said to prove that the necessity of joints to provide for contraction and expansion is not so apparent as supposed by engineers. The process has also been successfully applied to welding of wire cables.

USEFUL INFORMATION.

SIMPLE METHOD OF SMOKE CONSUMPTION.—William Westlake, of Brooklyn, N. Y., having given several years of study to the subject of smoke consumption has perfected a system whereby he claims smoky coal, tar, shavings and similar fuel can be used under boilers without smoke. In describing his invention which he has not patented, wishing to give the public the benefit of his experience, he says: I tried here in Brooklyn two methods of burning soft coal. First, it is important to know what soft coal is composed of. In one ton of soft coal one-half is water. This water becomes steam in the process of passing over heated fire brick and the coke. Before the air is applied the gases must be heated. Instantly, after the coal is freshly put on, give it all the air possible from forty to one hundred seconds. Georgia pine shavings want over two minutes. In burning shavings the feed doors can be kept open all the time—so the doors might be kept open for coal, if the fireman would take the trouble to keep the coal close up to the top of the brick arch. Fine coal should be used. When the bank of coal is turned into coke, a long poker should be used to get the ashes into the ash pit—the fresh coke should be broken up to take the place of previous charge. I have thoroughly tested this simple method to perfection. Firemen are like sailors—they think they know everything, and I found it very difficult to introduce here; besides, there is no way to enforce it. There is a saving of about 20 per cent. This pays for keeping the brick work in good order and the fireman will have to be compensated for a little extra attention.

COLORS IN TEMPERING IRON.—Investigation as to the cause of the production of colors in tempering iron satisfactorily shows it to be due to the formation of thin films of oxide on the surface of the metal when it is heated in the presence of air. It also appears from recent researches that the oxide so produced is practically transparent, first, because the sequence of colors is what would be expected in films of a transparent substance when the thickness of the films gradually increases; also, because of observations on the reflected light, the color of which varies somewhat at different angles; but chiefly because it is found that on increasing the temperature a little above the point necessary to produce a dark blue, the color gradually disappears, and the surface, though covered with more oxide, becomes almost colorless again. The colors being the result of oxidation, it is probable that the nature of the surface to be heated, its freedom from any soiling, and the length of time during which it is heated must exert a considerable influence on the shade produced.—*Iron*.

ARTIFICIAL DIAMONDS.—Mr. Streeter, in his book on "Precious Stones and Gems," says that a good deal was heard at one time of the experiments of Mr. J. B. Hannay, of Glasgow, in making artificial diamonds. The philosopher's stone, it was said, was at length discovered. Then the subject was allowed to drop. Here is the sequel. The so-called diamonds were found to crumble to pieces when placed on the wheel for cutting. Worthless as these gems proved to be, they were not obtained without much labor, expense, and above all, risk to human life. A peculiar mixture of paraffin and certain metals and minerals was put in a strong wrought-iron tube, and subjected to the heat of a reverberatory furnace. In most of the experiments the tubes exploded, and, in some cases, the assistants were injured in consequence.

TESTING THE ATMOSPHERE OF MINES.—A method of examining the atmosphere in mines is being used at Kolscheid, near Aachen, Germany, in which electricity is employed. Briefly, it is as follows: A gas-holder is placed in the chief ventilating shaft, and is so arranged that it becomes filled in twelve hours; in this way it is possible to obtain a fair average sample of the mine air. The air thus collected is examined by means of a Coquillion's grisometer.

Any free carbonic acid gas that may be present is absorbed by caustic soda, and its percentage estimated by noting the diminution in bulk. The marsh gas is then decomposed by a platinum wire heated to incandescence by means of an electric current. A further diminution in bulk takes place, and this being observed, the percentage of marsh gas in the pit air can be calculated.

FLOUR PASTE.—To make a paste that will "stick like grim death," heat some water to boiling, then stir in flour, keeping it free from lumps. The best way is for one man to stir the water while another drops in the flour through a sieve. The stirring is continued until the paste is as thick as desired, then continue a little longer to make sure that there are no lumps of flour left in the mixture. Care should be taken that too much flour is not sifted in, or the paste will become too thick, as it takes a little time for the last flour put in to affect the rest of the paste. The paste may be strengthened by adding to the flour one-sixth its weight of powdered resin. To make the paste keep for months without souring, add a few drops of oil of cloves. A little carbolic acid will do as well, but it does not suit the nose as well, by a good deal.—*Blacksmith and Wheelright*.

M. M. SCHNEIDER ET CIE. (Cruesot) manufacture a steel containing from two to four per cent of copper, which is stated to impart a greater resisting strength, elasticity, and malleability to the metal.

GOOD HEALTH.

Does Danger Lurk in Aluminium.

Despite the efforts of German chemists to prove the innocuity of aluminium in contact with foods and fluids, says *Iron*, events occur from time to time which tend to show that the metal exercises a deleterious effect on alimentary substances. Private advices from German military sources report a circumstance which is likely to impress upon Continental military authorities the necessity of caution in the adoption of aluminium as a material for soldiers' mess-tins and water-bottles. The extreme lightness of the metal was considered so advantageous that water-bottles made of it were not long ago issued to some of the German troops. A soldier belonging to an infantry regiment stationed at Nuremberg had his bottle partly filled with cognac. After several sips he was taken ill, and vomited. On hearing the particulars the doctor decided to send the bottle and its contents to an analyst. The latter discovered in the bottle some brownish-black spots, round in shape, which, under analysis, were found to contain large proportions of aluminium and iron. The cognac had become muddy. The analyst declared that the cognac had caused a strong corrosion of the metal. On the other hand, Messrs. Browett, Ashberry & Co., of Birmingham, write as follows: "We have for the last two years been experimenting with aluminium, with a view to introducing it to our customers, made up into ordinary table-ware, and the following are some of the results arrived at. A flask made of it has been in constant use by one of our friends for the past eighteen months, containing at different times brandy, sherry, claret, beer and milk. So far not the slightest ill-effect has ever been perceptible, and not the least smatch or bad taste has been imparted to the liquor as is so often the case with common metal and poorly electroplated flasks. For dishes the result seems equally satisfactory, neither meats, gravies nor sauces—hot or cold—no matter how long they have been allowed to stand, have any effect upon it, neither are they acted upon by the metal. Apple juice, which is considered a severe test, and acts and is acted upon by most metals, with aluminium appears to be quite innocuous. Tea also appears to be equally wholesome made in an aluminium vessel as in a real silver one, and even after standing several days there was no discoloration of the metal and no perceptible change in the tea. Vinegar, which acts upon most metals, does not appear to touch aluminium nor be affected by it, neither does potash nor soda water. We all know that tin is a perfectly pure and harmless metal, and that fish and meats may be preserved in it for an indefinite period, but not so the common solder with which meat tins are put together, hence the many fatal results from eating tinned salmon and lobster. In cases where deleterious effects have resulted from the use of aluminium vessels, it is probable that if the metal had been assayed it would have been found to be made of an impure and spurious alloy—not pure aluminium."

THE Northern Pacific Railroad Company has appealed from the decision of the United States Court of Montana, asking that Chas. W. Cannon et al. be restrained from holding a certain quarter-section of land which was deeded to the railroad by the Government as agricultural land, but which the defendants took up as mineral land. The question involved is whether the land is mineral or agricultural, and the Land Office and United States Court of Montana have decided it is mineral land.

A SECOND LEADVILLE.—An exchange says that Creede camp promises to become a second Leadville. The number of people going into this wonderful camp is unprecedented in the history of Colorado, except during the Leadville excitement. It is estimated that now that the townsite is located, there will be 10,000 people in the camp by June 1st. The new discovery is only reached by the Denver & Rio Grande railroad, and there is no staging.

PREPARATIONS are being made at Fort Wingate for the expedition which will start May 10th, to accompany the commission to examine the Acarizo Mountain country and to report on its character, whether or not it contains mineral and precious ores, and, if so, to treat with the Navajos for its transfer to the United States.

Milling at Bodie.

The rehabilitated Standard mill of 20 stamps at Bodie, is one of the oldest in the district, and has been run steadily on ore from the Standard mine during the past year. The ore is crushed wet and run over silvered copper plates which take out about 80 per cent of all the free gold and silver contents. The major part of the remainder stays in the batteries, being too coarse and heavy to be thrown out through the screens and is extracted by amalgamation in the clean-up pan at the end of every month. The pulp leaving the plate is run over four Frue vanners with belts six feet wide, and the tailings from these are led into pointed settling boxes in order to get rid of the surplus water from the batteries and vanners before treatment in the pans. The thickened pulp discharged from the settling boxes is raised by means of a bucket elevator to a series of eight pans and three settlers, arranged on the Boss continuous system. From the settlers, after passing through an agitator, the tailings escape into the tailings-beds.

During the past year the mill crushed 15,704 tons. The average crushing for the first five months is 1249 tons, during which time a No. 10 (corresponding to 40 mesh) Russia-iron slot screen was used in the batteries. The average crushing for the last seven months was 1351 tons, a gain of 102 tons per month, accomplished by the use of a No. 0 (corresponding to 40 mesh) tin-punched screen.

Analysis shows the ore to contain no base metals other than a very small amount of iron oxide; nevertheless, it is only partially free milling, and the percentage of extraction is consequently low. The mercury on the plates and in the pans takes out all that will amalgamate. The remainder needs a different treatment, and this was described in last week's PRESS under heading of "Treatment of Tailings."

The present system of milling gives three to five per cent better results than that previously in use.

Richer ore gives higher results on account of carrying a greater proportion of free precious metal; while treating the lower grade, the extraction has only been maintained by the at least partially successful amalgamation of tailings in the continuous pans.

That, working on a lower-grade ore, they are obtaining a higher extraction than in previous years is certainly satisfactory, when it is understood that ore treatment is limited to a certain line of milling operation by the high condition of labor, expensive fuel and costly freights obtaining at Bodie. That milling is being done at a much reduced cost is shown by the fact that 15,704 tons of ore were crushed the past year, at a total milling expenditure of \$61,002.94, or \$3.89 per ton; when, as stated in reports, in 1891 but 11,498 tons were crushed at a cost of \$60,000, or over \$5.20 per ton.

The four concentrators produce on an average of 10½ tons of concentrates per month, worth from \$80 to \$100 per ton. This is a content of concentrable material in the original ore of two-thirds of one per cent, showing the ore to be hardly of a concentrating character. Nevertheless, the vanners once introduced cost so little to operate, while furnishing a high-grade product, that it pays to continue running them.

As the concentrates contained no sulphur and little or no base metal, Manager Leggett filled up two pans in the mill and put them through a specially adapted slow treatment, getting a yield of 31 per cent over that obtained by shipping away to reduction works.

A Carter magnetic separator, through which the dried concentrates were being passed in order to eliminate the magnetic iron oxide (of which they contain 5 per cent to 10 per cent) was discarded, as pan-amalgamation tests show 16 per cent higher

extraction on the original concentrates than on those that had gone through the separator, though the bullion produced was necessarily baser.

The concentrates are now being regularly treated by pan amalgamation, as the best and cheapest method of realizing on them quickly.

Careful chlorination tests, after roasting with salt and sulphur, have shown no higher percentage of extraction than that obtained by slow amalgamation, as practiced at Bodie. Moreover, the loss of gold and silver in roasting is considerable (15 to 20 per cent), and the cost with wood at \$10 a cord, greater than that of amalgamation, for which the mill is already fitted.

Foundries and Freight Rates.

The foundries of this city labor under some disadvantages in the matter of supplies of coal and iron, since neither of these essentials in their business are obtained in this State. They exist here, it is true, but the coal is poor and no iron is made from the known deposits of ore. Most of the coal used is foreign and pays duty, and the iron the same way, though some of this comes from the East. Of course, as a tariff must be general, our people are sufferers that those in the East may be benefited. Wages are high here, too, and that is another disadvantage.

But the great drawback to industrial advancement is the limited area for the shipment of machinery, etc., owing to the freight rates charged by the railroad company. If that company were more public spirited or cared to encourage home manufactures at all, it might adjust its tariff in such a way as in a measure to offset the local disadvantage of the national tariff.

It was only a few weeks since that a heavy contract for mining machinery went to Chicago instead of this city, because they could ship the mill, etc., to Durango, Mexico, cheaper from Chicago than from here.

This machinery had to go via El Paso over the Mexican Central to Jimenez, the nearest station to the mine. The distance is greater from Chicago by one-third, but the freight rates on the other lines were very much less than on ours.

This is a state of affairs that admits of remedy, but this must come from the railroad. The foundrymen, who fought the late strike so successfully, ought to make a united effort in their own behalf, and try and convince the railroad company that it is making a mistake in restricting our market as it does. The machinery trade of the coast States of Mexico on this side naturally belongs here, and we formerly had it, but like the trade of the Northwest, it is gradually being lost. This is entirely due to railroad charges.

The foundries here all report business as dull, and less men are being employed than usual. They could do twice as much business could they ship any distance at the rates the Eastern men get. Perhaps, now that Mr. Huntington is coming here to live, he will see that a more liberal policy would increase our local manufacturing business and give his trains more East-bound freight. At any rate, it is to be hoped he will do something to remedy the present condition of affairs.

GEO. OHLEYER, one of the delegates to Washington from the California River and Harbor Convention, has returned. He reports that there is but little doubt the appropriations for the rivers and harbors in California will pass without pruning. About Caminetti's bill he is not very communicative.

THE Mechanics' Institute has appointed a committee consisting of Marsden Manson, A. S. Hallidie, M. A. Dorn, I. C. Stump and J. K. Firth, to assist in entertaining the American Society of Mechanical Engineers during their visit in this city.

The Late L. L. Robinson.

L. L. Robinson is dead. He died on Thursday at his ranch, Los Medanos, Contra Costa Co., after a long illness.

For many years this gentleman took the lead in the hydraulic mining fight in this State, and he was known to most of the miners of California. He was an aggressive man, and carried on the contest in an aggressive manner. It did not win, and as a result he was not as popular with the miners as when he first took the presidency of the old Miners' Association. But he spent a great deal of time and a great deal of his own money in fighting these debris cases, and brought into them a wonderful amount of energy and intelligent study. Mr. Robinson had his own ideas as to the way the contest should be carried on by the miners, and was somewhat impatient of contradiction. Those who were helping to pay the expenses did not always agree with him, so there was eventually some friction in the Association. It finally disbanded, when it became evident that the decisions were all adverse to the mining interests. By his immediate associates and those who knew him best, Mr. Robinson was well liked, and they speak highly of his many good qualities.

Mr. Robinson was originally a civil engineer, and came to California in 1854, where he built the first railroad on this coast—the Sacramento Valley road. He was the first president of the Giant Powder Co., and also president of the North Bloomfield Mining Co., of which, at the time of his death, he was the only survivor of the first Board of Directors of that famous company. He was also interested in other mining enterprises in this State. Mr. Robinson was unmarried and is understood to have left a large fortune.

THE EUREKA MILL BURNED.—The Eureka mill, on the Carson river, four miles from Dayton, was burned on the 21 inst. The mill, which is next to the largest in Nevada, cost \$350,000, and was worth at least \$125,000 at the present time. It was insured for about \$80,000. It was owned by Mackay and the bonanza people. Sixty men are thrown out of employment. The mill will probably never be rebuilt. The mill had 60 stamps, with a crushing capacity of 240 tons of ore in 24 hours. The only portion of the structure left is the iron work and the 30-inch Leffel water wheel that operated the machinery. The tailings that have accumulated represent a bullion value of several millions.

It is reported that the Bear Nest property on Douglas Island, Alaska, which a few years ago created considerable excitement in mining circles, both in Europe and America, is going to be thoroughly investigated this summer for the purpose of ascertaining whether the property has any merits, or is the stupendous fraud which it is now represented to be. About \$1,000,000 was lost in the speculation on this property.

DIANA.—At the annual meeting of the stockholders of the Diana Mining Company, 84,935 shares were represented and the following officers elected for the ensuing year: W. C. Ralston, President; Thomas Cole, Vice-President, and M. A. Jackson, William Bowers and George C. Hickox, Directors. R. R. Grayson was reelected Secretary and H. W. Coffin Superintendent.

In the Idaho mine, Grass Valley, 1900 level is looking very well. It is satisfactory to the owners. It is believed, for good reasons indicated in appearances, that the 2000 level will develop a good sized and a paying ledge. This is the deepest gold mining in the country.

WILLIAM PICKETT, for many years superintendent of the Quijotoa mines, has resigned, owing to ill health and the advice of his physician. D. C. Pickett has been elected as superintendent in his place.

UNDERGROUND WORKINGS OF THE STANDARD CONSOLIDATED MINE, BODIE, CAL. (SEE NEXT PAGE.)

The Standard Consolidated Mine.

The bullion product of the Standard Consolidated mine, at Bodie, for the last fiscal year was \$237,995, from which two dividends were paid. They disbursed, among other expenses, \$73,419 for mine labor, and for mill labor, \$26,646. The narrow ledges in this mine furnish, oftentimes, high grade ore, but not in sufficient quantity to keep the 20 stamps supplied, especially since the crushing capacity of the mill has been increased to 100 tons per month by the introduction of tin-punched screens. It is, therefore, essential to have available some considerable quantity of ore easy of extraction, even though it be of low grade, as mixing with the higher grade ore referred to, gives a good milling value.

This mine was first opened by an incline shaft, and levels established therefrom at distances apart, on the slope, of from 100 to 150 feet. Subsequently, the vertical shaft located on the western portion of the claim was sunk, and levels run to connect with the existing incline levels, which connections were sometimes accurately made, and sometimes otherwise.

In a mine of this character, a network of ledges, where so much work has already been done and no accurate record kept, there must necessarily be a certain amount of groping in the dark, with the ever-present contingency of stumbling on old stopes on ground supposed to be virgin. To guard against this requires the prosecution of an amount of prospecting work far in excess of the ordinary conditions in mining, and makes imperative the investment in this work of a very considerable portion of the monthly earnings.

The appended maps show the past year's work in the mine and are taken from the annual report of the manager, Thos. H. Leggett. A great deal of work has been done on the 300-foot shaft level (242 feet from the shaft collar). From the top of the wide upraise from the Bulwer level, marked "double-chute" on the map, a crosscut was driven east, encountering, within 40 feet, the top of an old stope on the third south ledge, in which remained rich ore, from 18 to 24 inches wide, that had never been stoped, and it is to this rich ore, chiefly, that the good bullion product of March to June, inclusive, is due. Drifts were opened here on this level southward, connecting with the main south crosscut and Jacob Klein ledge, and northward through old stopes of the third south ledge. These remnants of former rich stopes were worked out last June.

The north drift was continued 77 feet to its intersection with an old east and west crosscut, as shown on the map, and in following a narrow six-inch seam eastward into the footwall, it opened out into a body of ore from 18 to 30 inches wide, assaying \$70 per ton.

It is a noticeable fact that many of the intermediate ledges that have a regular strike of nearly north and south in the southern and western portion of the mine, turn abruptly to the east as they near their northern limit at about the central portion of the claim, forming a sort of horizontal "saddle," with often good ore bodies at their eastern extremities. This is markedly the case in the "West Bullion" ledge. In opening out this ledge toward the north, the western extension of the main crosscut was cleared out, and also the short northern drift at its extremity.

From here, Raise No. 7 was driven 64 feet, tapping the ledge at the bottom of the "Bulwer" stope, at the top of which the ore body was 6 and 7 feet wide. Driving north at the top of the raise for about 70 feet, showed the vein making an abrupt turn to the east at this, its northern extremity, with the ore body lying nearly flat, and averaging 5 to 6 feet between walls. This ore, however, was not as high grade as in the steeper portion of the vein, through

which Raise No. 7 was continued until 130 feet above the 300-foot level.

Here has been one of the most important developments in the mine during the past year, this ore body alone having furnished fully 4000 tons of ore since August last. The entire stope is timbered with square sets, in places over two sets wide.

Raise No. 8, from the 300-foot level, has opened up that portion of this West Bullion ledge lying between Raises Nos. 4 and 7, and they are still extracting a fair grade of ore from here.

There are still several hundred tons in sight in these stopes (7 and 8), with good chances of encountering more in the same vicinity.

In the Bulwer of 350 foot shaft level there has also been much exploration work done in the past year and it has met with very fair success. A main drift has been cleared out and continued for several hundred feet through the old 3rd South ledge stopes, and crosscuts were run but no new ledges were found. Winze No. 1 was sunk on the Hanging vein (the main vein being stoped out) and with this, winze connection has been made through raise B of the 400 level. This makes available some 600 or 800 tons of ore on which very little stoping has been done.

On the 400 shaft level the chief work has been done on the 4th South vein, and on several flat east and west feeders, south and east of the V (see map). Prospecting, south of the V, developed a flat east and west ledge with some high grade ore. Later, the ledge was opened up below the line, but the ore is of too low a grade to mill. The southern portion of this level yielded ten years ago much rich ore, but the ground had been pretty thoroughly prospected and worked.

On the 550-foot inclined level but little work was done last year, though more ore is now coming out.

Extraction from the large body of low-grade ore opened up in the far northern portion of the 500-foot shaft level has been going on steadily the past year, and there still remains in the top of the stope near the 400-foot level, 500 to 600 tons of the best ore; the grade of which improves going upward. No work has been done on any of the lower levels as they were thoroughly prospected years ago, without a single discovery of value being made. The veins, many of them, gave out before the 700 foot level (697 feet from the shaft collar). One or two of the main fissures can be traced in this level, but the vein filling is clay and decomposed wall rock without a vestige of ore, and seldom if ever any quartz. Work is therefore confined to the productive zone above the 500-foot level.

Mr. Leggett states that the company has "in sight" in the stopes, at present time, over 3000 tons of ore, not taking into account that which the old stope fillings will furnish, amounting certainly to hundreds of tons. Ore "in sight" means that quantity which is available without any further prospecting work, and while at present there would be but a few months' supply should such work cease, the vigorous exploration that has been and is carried on unceasingly, bids fair to maintain proper ore reserves for some time to come. In the 500-foot level, half way between this and the 400-foot level, they are crosscutting the territory in the southern part of the mine, that most abundant in rich ledges, with good chances of finding some unworked portions of these.

In the 400-foot level they are exploring a promising feeder or branch vein of the old "Main Standard" ledge that carries four feet of good ore close to the main vein, and toward the south for the few feet thus far driven on it, holds 14 inches wide in ore above the average grade. In the 350, or Bulwer line, they have virgin ground of promising character east of the Grant ledge. In the 300 level they are driving a crosscut in a field hitherto totally unexplored, lying just west of the shaft, and this Mr. Leggett

considers to be especially promising ground for encountering ore bodies of old-time size and quality.

The ore reserves in the mine are sufficient for present needs, exploration work is being diligently pushed in promising sections, and the milling work is steadily improving, which latterly each month has shown a greater margin of profit. The outlook for the continuance of quarterly dividends is considered a fair one; but until new unworked ledges are discovered in the mine, no positive assurances can be given in regard to this.

Mr. Leggett's report is quite complete and gives all necessary details for the information of the stockholders. But the printer persists in calling a "winze" a "wing," a "screen" a "screw," and otherwise shows complete ignorance of mining terms. The tabular work, too, is rather odd in the results. In the November and December returns, the printed figures show respectively \$18,215 and \$17,949 obtained from the tailings, while they got nothing at all out of the ore itself. Of course Mr. Leggett did not write it that way, as the total footings show.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, Silver Star Mining district, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 6th day of April, 1892, an assessment (No. 10) of Twenty-five cents (25c) per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 9th day of May, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 31st day of May, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DUBROW, Secretary.
Office—Room No. 69 Nevada Block, No. 309 Montgomery St., San Francisco, California.

DELINQUENT SALE NOTICE.

KEYSTONE CONSOLIDATED MINING COMPANY,
Location of principal place of business, San Francisco, California. Location of Works, Amador City, Amador county, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the 9th day of March, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cent.	No. Sh. res.	Amt.
A. B. McCree	8	2,334	\$5,835 00
A. B. McCree	6	134	335 00
A. B. McCree	57	533	1,332 50
A. B. McCree	59	99	247 50
A. B. M. Cree	114	100	250 00
John Clement	102	134	335 00
M. J. McDonald	129	200	500 00
M. J. McDonald	137	500	1,250 00
E. D. Rue, Trustee	138	925	2,312 50
Wm. Letts Oliver	133	40	100 00

And in accordance with law, and an order of the Board of Directors, made on the 9th day of March, 1892, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, No. 310 Pine St., room 43, San Francisco, California on MONDAY, the 9th day of May, 1892 at the hour of 12 o'clock m. of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. H. ISHAM, Secretary.
Office, No. 310 Pine St., room 43, San Francisco, Cal.

AMERICAN EXCHANGE HOTEL.

SAN FRANCISCO, CALIFORNIA.

ROOMS AND BOARD BY THE DAY, \$1 TO \$1.50; by the week, \$8 to \$10; by the month, \$25 to \$40. Good rooms and elegant table. Meals, 25c. Single Rooms, 50c. Free B'us.

F. A. HUNTINGTON, PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to a desired fineness by the centrifugal force of the rollers as they roll over it.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

OFFICE AND WORKS, 213 TO 219 FIRST STREET, SAN FRANCISCO, CAL.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

The following brief list by telegraph, for April 19 will appear more complete on receipt of mail advice:

California—George W. Stevens, San Francisco, fruit carrier; William J. Thomas, San Francisco, balance scale; Charles W. Weston, fruit box; Lowell J. Gilman, Santa Rosa, pruning implement; Clarence V. Heath and A. G. Miller, Sacramento, car ventilator; Ellsworth D. Meddelauff, Stockton, riveting machine; Wells H. White, Los Angeles, vehicle hub; Washington—Elbert Della Sprague, electric lamp hanger; Robt. Frost, Olympia, blotting pad; Remembrance L. Kirby, Pomeroy, riding harrow; Albert P. Vesen, Seattle, musical instrument.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONCENTRATOR—Adolph Schulenburg, S. F. No. 473,644. Dated April 26, 1892. This invention relates to certain improvements in apparatus for concentrating material which carries gold, amalgam, sulphurets, and other valuable material, and it consists in a novel combination of inclined tables, so arranged with relation to each other that valuable material of various weight and fineness is gradually separated from the lighter and worthless stuff and collected in proper receptacles. The tables and surfaces are so mounted as to receive a shaking and oscillating motion, and are also subjected to a percussive action which aids in the operation. Much of the novelty lies in the peculiar arrangements of the inclined tapering tables and the channels between them, not to be well understood without illustrations.

INCUBATOR—Edmund Harrison, Tulare, No. 473,664. Dated April 26, 1892. This incubator consists of an exterior double-walled, non-conducting case, with interior arrangements for a series of tanks to contain hot water, while the egg-containing trays are placed within the spaces surrounded by these water tanks. By reason of the capacity of water to retain heat, it is found that the water tanks thus inclosed will retain approximately a certain degree of heat for twelve hours, and by connecting the tanks with an exterior lamp-heated boiler, it can at any time be raised to a proper degree by a short application of heat to the boiler. Beneath the case is a brooder for young chicks, receiving its heat from the egg compartment, by reason of a thin conducting partition or floor between the two.

CASH REGISTER—R. W. Whitney, S. F. No. 473,719. Dated April 26, 1892. This is an improvement in that class of devices known as cash registers, and employed for the purpose of keeping an account of all amounts which are received, and in connection therewith of a money drawer which is operated so as to be opened by the operation of the register.

DRINK MIXER—Richard D. Schroeder, S. F. No. 473,643. Dated April 26, 1892. This invention relates to that general class of machines for shaking liquids, and especially to that machine of this class patented by the same inventor, August 18, 1891. No. 457,938. The object of this invention is to simplify the general construction of the machine.

CABLE RAILWAY SWITCH—Ira Bishop and Arthur F. L. Bell, S. F. No. 473,652. Dated April 26, 1892. This invention relates to that class of switches especially adapted, by reason

of their control of the slot, to cable railways. It consists in opposing rotary sections of the slot-irons so mounted that the position of the space between them at one end shall always remain constant and in alignment with the leading main slot, and at the other end shall remain variable and be brought into alignment with the outleading main slot, or with the branch slot, according to the positions to which the sections are rotated. It also consists, in connection with said rotary sections, of the novel mechanism by which they are operated and the novel connections by which the track-switch is operated simultaneously with the slot-switch sections. The object of the invention is to provide a simple and effective switch for the slots of cable railways, accurate in its operation and adapted without fail to throw one slot fully open while the other is fully closed.

ENOINE—Miles B. Dodge, S. F. No. 473,657. Dated April 26, 1892. This improvement consists of a pair of cylinders placed end to end, having independent main and cut-off balanced valves and pistons, joined together by a trunk which passes through the intermediate head between the cylinders, so that steam is first admitted alternately into the spaces around the trunks to act as a high pressure against the smaller area of the pistons, and is thence conveyed through the valves to the larger area at the opposite ends of the pistons and expanded therein for the return stroke of the pistons. By the operation described in the patent the inventor provides a very complete and serviceable double engine, with great economy in the use of steam.

MACHINE FOR CUTTING SCREW-THREADS ON BOLTS—H. W. Pudan, Sacramento, No. 473,640. Dated April 26, 1892. This invention is intended to increase the output of bolt-cutting machines, while, at the same time, reducing the amount of labor necessary for the purpose. The invention is designed to be applied to any bolt-cutting machinery. In the patent it is shown as adapted to what is known as the "National Bolt Cutter," and it is designed to cut screw-threads upon three-quarter track-bolts, which have a thread cut about two inches upon the end of the bolt, and in which that portion of the shank adjacent to the head is made flattened or oval in section, so that the bolt may be held fast while the dies are cutting the thread upon its end.

LUBRICATOR CUP—Henry Ives, S. F., assignor to A. W. Sanborn. No. 473,755. Dated April 26, 1892. This device for lubricating the moving parts of machinery consists in the combination, with a cup or receptacle for holding the lubricant, of a valve-chamber, a valve opening downwardly therefrom and from the receptacle, and a means for regulating and controlling the opening of the valve. With this device, the flow of the lubricant may be accurately regulated to suit the conditions under which it is to be used.

POCKET CASH ACCOUNTANT—James Davis, S. F. No. 473,656. Dated April 26, 1892. This device consists of a cylinder having a series of rings or sleeves fitted to its exterior surface and movable around it, these rings having figures or characters by which the debtor and creditor sides of an account may be indicated, together with dates and other matter connected therewith. The object of the device is to keep the account of receipts and expenditures in a mechanical manner, either permanently or to be transferred to books at certain stated times, if desired.

CIGAR AND ASH HOLDER—E. A. Tibbitts and C. W. Sadler, Sutter Creek, Amador Co. No. 473,646. Dated April 26, 1892. This device is a cigar and ash holder and furniture protector. Persons who smoke are in the habit of laying their cigars upon any convenient piece of furniture, as the edge of a table or desk. The wood-work is thus charred and the ashes of the cigar fall upon the carpets. This device is intended to protect the furniture, to provide a convenient support or holder for the cigar and a receptacle for the ashes which fall from its end. It consists of a corrugated, grooved or channeled plate, with a connecting clamp and screw, whereby it may be adjustably attached to the edge of a table, and a holder swiveling on the clamp so it may be concealed beneath the table or swung out under the end of the cigar to catch the ashes from the cigar resting on the plate.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Books on Working Ores.
By GUIDO KUSTEL, M. E.
ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.
This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed with facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 158 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By C. H. AARON.
AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

DIVIDEND NOTICE.
OFFICE OF THE PACIFIC COAST BORAX COMPANY, San Francisco, April 30, 1892. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 17) of One Dollar (\$1.00) per share was declared, payable TUESDAY, May 10, 1892, at the office of the company, No. 230 Montgomery St., Rooms 11 and 12. Transfer books will close May 5, 1892, at 3 o'clock, P. M.
ALTON H. CLOUGH, Secretary.

BOOKS ON ASSAYING.

By C. H. AARON.
Part I.—Gold and Silver Ores.
SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" in written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:
Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.
The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1890. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.
Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:
Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.
One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.
Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

A New and Valuable American book for Prospectors and Miners.

WELL SUPPLIES All Kinds, Water, Gas, Oil,
Mining, Ditching, Pump-
ing, Wind & Steam Mach'y, Encyclopedia 25c.
The American Well Works, Aurora, Ill.
13 S. CANAL ST., CHICAGO, ILL. Branch Houses,
22M STREET, DALLAS, TEXAS.

PATENT HOOP CLAMP
ALL SIZES.

MALLEABLE IRON HEADS, WROUGHT IRON BOLT.

These Couplings are the Best in the World, Most Powerful, and Cheapest. Work freely, having a direct pull with
right and left screw, acting on a Ball and Socket Joint. We use them extensively
in our Tank Building Department.

WELLS, RUSSELL & CO., Heavy Tank Builders,
Mechanics' Mill, Cor. Mission and Fremont Sts., San Francisco.

THE GIANT POWDER COMPANY.

— PATENT OWNERS OF —

**NOBEL'S DYNAMITE, NOBEL'S EXPLOSIVE GELATINE, NOBEL'S
GELATINE-DYNAMITE, AND THE JUDSON IMPROVED POWDER.**

Best and Strongest Explosives in the World.

JUDSON POWDER.

The only Reliable and Efficient Powder for Stump and Bank Blasting. Railroad Contractors and Farmer
use no other. As others IMITATE our Giant Powder, so do they Judson, by manufacturing
an inferior article.

BLACK POWDER.

The Giant Powder Co. having built Black Powder Works, with all the latest Improvements, at Olipier Gap, Placer
County, known as **THE CLIPPER MILLS**, offer this powder and guarantee it the best.

CAPS and FUSE at Lowest Rates.

THE GIANT POWDER COMPANY, 30 California St., San Francisco.

CONCENTRATING MACHINERY.

Blake, Dodge and Comet Crushers, Cornish
Crushing and Finishing Rolls, Hartz Plunger
and Collom Jigs. Frue Vanner & Embrey
Concentrators, Evans', Calumet, Collom's
and Rittenger's Slime Tables. Trommels,
Wire Cloth and Punched Plates. Ore Sam-
ple Grinders and Heberle Mills.

Educational.

JOHN T. EVANS,

Assay Office and Chemical Laboratory,
ROOMS 46 AND 47 MONTGOMERY BLOCK, 628
Montgomery Street, San Francisco. For nearly 15
years with Thomas Price, as Chief of the Ore-Assay and
Analytical Department. Lessons given in Assaying and
Chemistry.

School of Practical, Civil, Mechanical,
Electrical and Mining Engineering,
Surveying, Architecture, Drawing and Assaying,
728 MARKET ST., SAN FRANCISCO, CAL.
Open all year.

A. VAN DER NAILLEN, President.
Assaying of Ores, \$25; Bullion and Chlorination Ass'y,
\$25; Blowpipe Assay, \$10. Full Course of Assaying, \$50.
ESTABLISHED 1864. Send for Circular.

HOPKINS ACADEMY,

AKLAND, CALIFORNIA. A FIRST-CLASS, SELECT
School. Early application necessary. During year
1891-92, TWENTY-FOUR APPLICANTS were refused
for want of room. Next term begins August 2, 1892.
W. W. ANDERSON, Principal.

HEALD'S

BUSINESS COLLEGE,
24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS
College instructs in Shorthand, Type Writing, Book-
keeping, Telegraphy, Penmanship, Drawing, all the
English branches, and everything pertaining to business
for six full months. We have sixteen teachers, and give
individual instruction to all our pupils. Our school has
its graduates in every part of the State.

SEND FOR CIRCULAR. E. P. HEALD, President.

C. S. HALEY, Secretary.

ACTUAL BUSINESS PRACTICE.

LIFE SCHOLARSHIPS, \$75.
No VACATIONS. DAY AND EVENING SESSIONS.
Ladies admitted into all Departments.
Address: T. A. ROBINSON, M. A., President.

LESSONS BY CORRESPONDENCE
IN THE COMPLETE THEORY OF

COAL AND METAL MINING,

mation. No. 220 Market St., San Francisco, Cal.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, May 5, 1892.

Rains and cool weather the past week have changed the complexion of things from a commercial point of view. A large number of localities where little or no grain was expected to be harvested, now promise a fair yield, while sections where only a fair yield was looked for, now give promise of a full average. The improved condition of growing crops is a source of congratulation, and is calculated to inspire confidence with the trade. General business is about as heretofore reported, but with clearing weather a large increase is looked for in the volume of goods which will be sent out. Iron workers report fair to active business. The local money market continues easy, with a plethora of funds reported, owing to the absence of any large speculative or legitimate demand. There is a decided improvement and building boom on in the different cities and agricultural districts in this State. This gives employment to a large number of mechanics and other laborers, besides calling for considerable sums of money; but the latter soon finds its way back into the general reservoir to be again put out for the same purpose. State laborers are busily employed, which looks well for the State's future prosperity. We doubt very much if there was ever before a year in which laborers in this State were so generally busy as they now are.

In referring to the financial situation at the East, Iron Age of April 28th says that the accumulation of money at commercial centers is about the same as in the fall of 1891. The market is either distrustful or fails to discover opportunities for profitable investment. The most notable feature is the state of foreign trade, imports having quite recently become disproportionately large. At the same time, the exports are declining, and apparently, as a natural consequence, another outward movement of gold has commenced, but a leading New York banker remarks, "It is safe to say that the amount yet to go forward will not exceed \$15,000,000." According to another, gold exports are caused by disturbances on the European Continent rather than the condition of trade at home. The deplorable state of Italian finances may be a sufficient explanation. At the same time, Austria and Hungary are contemplating a measure of financial reform, to be submitted to Parliament early this month, which places a premium of 10 percent on gold taken in payment of custom duties. In April, 1891, the shipment of gold averaged over \$4,000,000 a week, and in May the loss was \$30,000,000. Our Eastern and European mail advices look very much as if the money markets are being manipulated by a strong financial syndicate.

SILVER—The Government completed its purchases of fine silver for April on the 27th ult. The awards for the month were as follows:

Date.	Price.	Ounces.
April 1.....	\$87.50 to \$7.58	325,000
April 4.....	\$7.58 to \$7.58	494,000
April 6.....	\$7.58 to \$7.58	220,000
April 8.....	\$7.58 to \$7.58	224,000
April 11.....	\$7.58 to \$7.58	291,000
April 13.....	\$7.58 to \$7.58	420,000
April 15.....	\$7.58 to \$7.58	60,000
April 18.....	\$7.58 to \$7.58	245,000
April 20.....	\$7.58 to \$7.58	58,000
April 22.....	\$7.58 to \$7.58	58,000
April 25.....	\$7.58 to \$7.58	380,000
April 27.....	\$7.58 to \$7.58	225,000

Public awards.....4,019,000
Private purchases.....481,000

Monthly quota.....4,500,000
Purchases for account of May were commenced on the 2d. The size of the offerings last month varied from 190,000 ounces on the 15th to 941,000 ounces on the 22d.

The markets at home and abroad show more strength, yet there appears to be a mixture of uncertainty which makes it difficult to predict the future. English mail advices report a large balance due India, which will have to be met by silver shipments to that country. Besides this, there have been very heavy sales of Indian wheat for shipment to England and the Continent, and a low price for silver, this will also necessitate the buying of silver. When the market is entered to meet the above requirements, the market value of silver is very apt to make rapid advances. In other words, it looks as if silver has been cornered with the view of making short sellers pay dearly for their temerity.

MEXICAN DOLLARS—The market is dull but firmer at around 69 1/2 cents.

QUICKSILVER—The market is weak at quotations. Receipts the past week aggregate 106 flasks, and exports by sea 75 flasks to Mexico. The exports the past month by sea aggregate 355 flasks. For the first four months of the year the exports aggregate 376 flasks, distributed as follows: To New York 2100 flasks, Mexico 1015, Australia 387, British Columbia 200, Central America 39, and New Zealand 20.

LIME—Receipts the past week aggregate 1832 bbls. There is a continued few demand.

ANTIMONY—The market shows a firmer tone in sympathy with the East. New York mail advices quote as follows: 10.85@11c for Hallett's, 12.25@12c for LX and 14.75@14c for Cookson's, and 13c for Crown brand.

BORAX—Exports by sea the past week aggregate over 400 ctns. to New York. We are informed that the East is making more liberal calls on this coast for supplies.

LEAD—The market is steady. New York mail advices report as follows: Consumers in this vicinity are extremely conservative buyers, and that fact seems to be somewhat of an obstacle in the way of advancing prices. It is the fact, however, that the available supply on the spot is unusually light, and offering from the sources of supply seems to be unusually reserved as well, indicating a strong position superficially at least.

TIN—Imports the past week include 20,767 boxes of plate from Liverpool. The market for both pig and plate shows considerable strength. English cables report as follows: "Tinsplate market remained quiet. Inquiries plentiful and large lines offering, but prices are unsatisfactory. Shipments are heavy. The Landore Tinsplate Company, Swansea (seven mills), have suspended. Three Welsh firms, it is reported, contemplate erecting tinsplate works in the United States."

PIG IRON—The market is fairly firm for foreign, in sympathy with European advices. American spot, on passage or for shipment buyers favorers. Iron Age, in its review of the New York market, reports that "the domestic iron trade continues gloomy and depressed. Chicago and Detroit are the only markets in which pig iron has been at all active. Pittsburgh reports that the movement to shut down furnaces has come to a stop, and it is now given out that furnacemen making mill iron have an understanding to hold the price at \$12. A case of Bessemer pig is reported at \$13.75 at furnace in Wheeling district. A large order for domestic Ferro is reported taken at \$61, Pittsburgh, an exceptionally low price. Billets are weak."

COPPER—The market exhibits a steadily growing strength, but with no advance as yet in quotations. New York mail advices report a continued heavy consumption. London cables report a strong market,

New York market is quoted as follows: Arizona ingot at 11 1/2c, and common casting brands are valued at 11 1/4@11 3/4c.

COKE—Imports the past week aggregate 406 tons from Swansea. The market is fairly steady at quotations.

COAL—Imports the past week aggregate as follows: Nanaimo 5907 tons, Glasgow 2460, Leparture Bay 2520, Tacoma 4700, Seattle 2401, Coos Bay 500, Swansea 3100, Baltimore 3000, Newcastle, N. S. W., 4269. Total 28,687 tons. The market is dull and heavy for all descriptions. Imports are free, while the demand is brisk. Heavy rains and improved crop prospects are against the market.

Mining Share Market.

SAN FRANCISCO, May 5, 1892.

The market the past week was relieved of its moribund downward tendency, by small upsurges. Many chippers and outside traders took advantage of the small upsurges to short the market. They wished to make a deal, changes in the personnel of the officers of several of the mines would be made and the working of the mines and milling of ore would be carried on to conform to the law under which the companies incorporated. The Hale & Norcross management is the only one that furnishes weekly letters which fully comply with the law. Outside operators must not labor under the impression that mine superintendents in giving full detailed reports of the work done in the mines and in the milling of ore, will bring the millennium for them and that they will roll in wealth; for unless the ore is in the mine, dividends cannot be declared and paid. Silver mining is very expensive, considerably larger than the rule of gold mining. While saying this it is only North End mines and of Hale & Norcross and Savage mines is doing hard work to correct the many abuses which have crept into the system of mining and milling of ore, in vogue on the Comstock lode. These abuses cannot all be rectified in a day, or in a week, or even in a month; they have to be taken in rotation, and, therefore, requires time. Besides correcting the abuses on the Comstock, the management above referred has had and is now having experiments made with the refractory and also low grade ore by which they can be reduced and be made to pay a handsome profit over and above the cost; whether anything will come out of the experiment is as yet an open question.

In outside mining shares the market has been dull. Nevada Queen, one of the Tuscarora district mines, has shown considerable life and gradually advancing prices. Who knows but what the shares in this mine will pull outside shares out of the net into which they have drifted. The Bodies have ruled dull but steady. The Quilotos continue worthless except to mine officers who draw salaries.

The Comstock mill, which was running on Con. Virginia ore, was burned up last Tuesday. The loss of the mill is not felt, for there are several idle mills which can be used. Formerly we had fires in the mines and loss of life, but now we are treated to fires on the surface with loss of money to the miners.

Several brokers have notified customers to take up their accounts. This action of the brokers added to the general depression of the market, many holders had to sell. Who bought the shares forced on the market is a conundrum to many. With the share market so dull it seems to be a waste of both time and space to give much information from the mines. That the mines were never before in better condition for economical working, goes without saying, but in retaining such men as one of the officers of the Hale & Norcross in responsible office in their companies, looks as if the mill rings neither fear man or devil while in pursuit of bullion and securing mining shares cheap. The recent strike reported in Mexican is said to be improving. The joint west cross drift, 900-foot Union level, is said to have run into a new and favorable formation. If this cross drift was started with the Union shaft as a basis for calculating distances, then they are about up to a line with Scorpio, but if the Sierra Nevada shaft was taken as a basis, then they are near the ledge in its downward continuation from the west croppings. The recent find in both Potosi and Bullion is richer than officially reported. In Belcher, the recent strike to the west on the 300-foot level did not give cause for much optimism. Very encouraging news comes to hand from two of the Gold Hill mines, but then several of the companies will probably have to levy assessments before the rings can manage the shares in that end.

From the outside mines, news of the most encouraging character comes to hand from the Bodies. It looks as if several mines in that district will pay regular dividends. The "Razor Blades" the usual high-colored reports come to hand, which, perhaps, means more suicides if gudgeons buy the shares.

Mining shares opened weak and dull this morning. Points are out for lower prices before there is much in the market.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

BUTTE BELLE G M Co, April 25. Capital stock, \$3,000. Directors—James Gillman, Mark Strouse, A. W. Morgenstern, J. C. Boyd and Geo. C. Higgins.

HUNTON BAY CON. M. Co, April 25. Location, Grass Valley, Nevada Co. Capital stock, \$100,000. Directors—James H. Culver, Fred G. Cartwright and Austin Walrath, of this city, Alf Tregidgo of Grass Valley, and Geo. G. Allen of Nevada City.

HOME BUILDING CO, April 25. Capital stock, \$100,000. Directors—Julius A. Remmel and Geo. W. Shreve, of Alameda; Frank Shay, W. A. Harney, I. W. Ross, H. B. Soltan and O. W. Forsyth of this city.

DAVIS SELF-CLEANING WATER FILTER CO, April 27. Capital stock, \$100,000. Directors—Barclay Henley, Henry G. Meyer, Wm. Grosse, Chas. J. Swift, Chas. Sladky, James Herman and Joseph Davis.

PHOENIX M. & M. Co, April 20. Capital stock, \$500,000. Directors—John P. M. Harris, of Benton, Cal.; Arche Farrington, Reno (Nev.), L. A. Sanderson, Alfred K. Darbrow and Wm. C. Stadfield of this city.

HEWSON STEAM MOTOR CO, April 20. Object, to manufacture the Hewson rotary wheel engines. Capital stock, \$5,000,000. Directors—Robert Hewson, Joseph D. and Albert P. Redding, Joseph Wells and Alexander H. Rutherford.

AMERICAN EXPLORING CO, May 3. Object, to conduct a mining business. Capital stock, \$20,000. Directors—J. L. Rathbone, John H. Hammond, N. H. Harris, A. H. Ricketts and F. G. Corning.

MARTHA WASHINGTON M. Co, May 3. Capital stock, \$500,000. Directors—Mrs. Gertrude Smyth, Mrs. A. G. Watson, Mrs. M. A. Kenney, Mrs. Angie Griffiths, E. S. Morse, J. K. Burnett and J. E. Watson.

NOTE.—Norcross has unsold bullion on hand amounting to \$8446.22. Also 4500 pounds concentrates valued at \$353.30 per ton, and \$6673.50 in uncollected assessment. Con. Cal. & Virginia has unsold bullion valued at \$34,748.17. Michigan bullion valued at \$12,620.61. Nevada has \$16.80.

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

OLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l Supt.
MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puff-bled-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for Twelve Months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four foot table and are as easily set as the smaller tables and have the advantage of 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has valued monthly from \$5 to \$20 per ton and the tailings from not 1¢ to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.
C. J. CLARK, Gen'l Supt.

For any information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs"; for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt..... \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt..... \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sanson, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed] Supt North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, \$675, f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.

THE SAN JACINTO ESTATE—Office of the General Manager, CAJALCO, Oct. 30, 1891.
GEO. E. WOODBURY, Esq.—Dear Sir: I reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you. I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine and is doing fully one-third more work, with the concentrate usually clean, as from either of the machines it work here.
[Copy] Yours faithfully, S. HARRIS, Manager.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O. address, South Riverside, San Bernardino County.

CAJALCO, February 17th, 1892.
GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully, S. HARRIS.

GEO. E. WOODBURY, Man'r, 213 to 219 First St., San Francisco.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or other ore crushing machines now before the public.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from hooking on the sides and forming channels through the center. These slight riffles also serve very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a high percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

The Ingersoll-Sargeant Cold-Air Compressor.

The cut on this page shows the Ingersoll-Sargeant piston inlet cold-air compressor of class A, steam actuated. This is the only air compressor with cold-water jackets through the cylinder heads—no water enters the cylinder. The free air, before admission to the cylinder, is under thorough control, and may be taken from that point

cylinder is shown in one of the cuts on page 359. The inlet valve is also shown. In the cut, A is the cold water inlet. B, cold water discharge; C, jacket drain; D, oil hole for automatic oil cup; E, air inlet; F, air delivery; G, inlet valves; H, delivery valves; I, cold water jacket.

The air inlet valves are large metallic rings, which are not operated by springs, but which open and close by the natural momentum given to the valve by the move-

your pen-knife on the palm of your hand and thrust your hand forward and backward. You will thus have a simple illustration of the movement of this valve. You will see that at the instant that you reverse the direction of movement of your hand, the pen-knife continues on until the friction which holds it to your hand overcomes the momentum, which tends to continue its movement in that direction in which it was started.

the compressed air near the end of the stroke when the air is hottest. The simple jacket applied to air cylinders of other compressors has little cooling effect upon the air, because when the air in the cylinder reaches a point when the discharge valves open—that is, when it reaches the pressure represented by the gauge on the air receiver—there is but a small annular ring of exposed jacketed cooling surface; while with this cylinder this cooling surface is

INGERSOLL-SARGEANT PISTON INLET COLD-AIR COMPRESSOR.

which is the most favorable in its dryness, reduced temperature and freedom from dust. The admission of free air being through a single tube creates a constant and uniform draft of air in one direction only, thus filling the cylinder at each stroke with air at atmospheric pressure. In other air compressors, the air must be started from a state of rest. Indicator cards taken on the cylinders of this compressor prove conclusively that not only is the cylinder filled with air at atmospheric pressure, but in some cases the line runs above the atmospheric line to the same extent that it runs below it in other air compressors.

The concentrated piston inlet cold-air

ment of the piston. A study of the sectional cut will show that when the piston is moving in one direction, the ring valve on that face of the piston which is toward the direction of movement is closed, while that on the other face is open. This is exactly as it should be in order to discharge the compressed air from one end of the cylinder while taking in the free air of the other. The position of each valve is almost instantaneously reversed at the point when the stroke is reversed. This change in position takes place without springs or other influence than the natural momentum of a piece of metal which is carried in one direction and is instantly reversed. Place

The large ring air inlet valves which serve to admit the air are practically indestructible. Two of these valves were operated night and day for one year at an extraordinarily high speed, and on being examined, did not show evidence of wear.

The large ring air inlet valves admit of a large area of inlet with but a small throw of valve, thus quickly opening a large supply port and enabling a compressor to run at high speed without a reduction of efficiency, and with safety to the quick-moving parts.

There being no inlet valves in the heads of the air cylinder, the space otherwise occupied by these valves is filled with cold water, thus presenting a cooling surface to

largely increased by a cold head. Indicator cards taken on air cylinders of this compressor show a pressure line approaching nearer the isothermal than in any other except, perhaps, those that inject water into the cylinder.

Clearance spaces are reduced to a minimum. That this is true is evident from an examination of the sectional cut of this cylinder. There are no counter sunk spaces in the cylinder heads for inlet valves, but there is a single annular space to take the place of the large ring inlet valve. The valve covers this space at the end of each stroke, so that there is no dead space.

(Continued on page 359.)

Against Boycotts.

The Manufacturers' Side of the Case.

The Board of Directors of the Manufacturers and Employers' Association of this city has issued the following manifesto:

The Board of Manufacturers and Employers of California believe that the time has come when a universal and systematic effort should be made to put an end to boycotts and the pernicious interference of trades unions with the internal affairs of trade. Unless this be done, the already suffering industries of the city will soon become so badly handicapped as to be practically out of the race in the competition of the world. Every line of production has suffered from this cause. Tons of iron work of all sorts, formerly made here, are now shipped in from the East. Large quantities of printing are now shipped in from the East. California produces some of the best leather in the world, and yet the amount of leather products imported from the East is steadily increasing. The manufacturers of furniture are facing a ruinous competition. Much of the hardwood finishings for our buildings is prepared in the East and shipped here ready to be put in place. The lumber output is curtailed. Coasting vessels are laid up. Although the second wool-growing State in the Union, our output of woolen goods is ridiculously small and growing less. Eight hundred white cigar makers once found employment in San Francisco; now less than 200 work at their trade. Eastern barrels threaten to close our cooper shops. Eastern bottled beer competes with a superior San Francisco product.

FACTORIES GOING EAST.

Several factories have gone East, and more are expected to follow. Possessing an unrivaled harbor, a splendid location, a rich and vast subsidiary country and plenty of capital, the city ought to grow faster than the cities of the East. Instead, at the present rate, the next census will show a population of 200,000 in place of the 500,000 it ought to show. The loss of the city is the loss of the State. Stagnation means the consumption of less lumber, less grain, less fruit, less of everything the country produces. It means that the farmer must pay freight to distant markets. The firms in the Manufacturers' Association employ 40,000 people and pay \$100,000 per day in wages. What if these plants go East?

Wages are higher here than anywhere else in the world. According to the official report of the Bureau of Labor Statistics, they are more than 10 per cent higher than in Illinois; more than 20 per cent higher than in New York; more than twice the amount of wages in England, and more than three times the wages paid in Germany, France and Italy. While wages are higher, the hours of labor are shorter than in any other country except Australia, the cost of living is less, and the climate permits work all the year round. This is not due to the unions. It is natural to California. It would prevail if no unions existed.

NO DESIRE TO REDUCE WAGES.

The manufacturers do not complain of the wages. There is no desire to reduce them below the normal rate, which must always remain the highest. If permitted to do business in peace, the manufacturers could pay these wages and prosper. It is the element of uncertainty that kills. The labor leaders seek to control the men, and the manufacturer cannot manage his business to the best advantage. It is because the life of a business has heretofore been at the mercy of the boycott that manufacturers have been afraid to launch into new undertakings, improve their plants or push for new avenues of trade.

The levying and agitation of a boycott is always harmful—not perhaps to the particular industry sought to be injured, but to the community at large. It fomenta uneasiness. It alarms capital intended for investment. It creates that uncertainty which is the death of trade. It gives a bad impression of San Francisco to intending settlers. Boycott circulars always lie. It is not too much to say that not a single truthful boycott circular has been issued since boycotting began. Their misstatements slander the city and slander the men doing business here. They are pernicious, destructive and wholly bad.

A CRYING EVIL.

The boycott is a crying evil of our times. It is the persuasion of brute force. It does not belong to modern civilization. It is never honest. Walking delegates have been bribed to boycott competitors, and walking delegates have exacted bribes for immunity from boycotts. It is never just. When Cahn, Nickelsburg & Co. introduced new machinery into their factory, a committee of expert manufacturers reported that

the new rate on the new machines has actually increased the wages of the operator, yet a boycott was levied. The *Abend Post* is boycotted after the Typographical Union declared the boycott untenable and asked to have it raised. Wellington coal is boycotted long after the Wellington strike is declared off. Breweries are boycotted, notwithstanding that the beer drivers in a body protested against the wrong and declared that they would no longer permit the Federated Trades to dictate what they should eat, drink, wear and read. Dry goods houses are boycotted, although all their clerks declare against it. A boycott is in all respects a highwayman. He is an industrial wrecker. His single and simple proposition is, "stand and deliver."

These evils do not spring from the better judgment of the workmen themselves. They are the result of the system of paid walking delegates. It is a matter of common experience that a union supporting a walking delegate can never be at peace. The moment agitation ceases the men grow careless, do not attend meetings, and neglect to pay dues. The paid walking delegate finds his source of revenue growing precarious and his reputation as a leader growing pale. He fomenta discontent, creates a labor war, fills up his treasury, and is at once the observed of union men and the hero of the hour.

EVERYTHING TO LOSE.

The paid walking delegate has everything to gain from a labor war; the workingman has everything to lose. If a strike succeeds, the workingman is still a loser, but the paid walking delegate reigns supreme. Agitation is the life of unionism. None know this better than labor leaders. They have a slogan: "Agitate, educate, organize." But "agitate" comes first, and is the most important. This activity is good for the paid walking delegate, but it is ruinous to business and calamitous to industrious workingmen. When a workingman stops to consider the amount he has paid in dues to his own union, the amount in assessments to assist other unions in trouble, the amount he has lost in wages by going out on strikes, he sees at once that the union has cost him much, and gained him nothing. The average workingman does not desire to belong to a union. He does not attend the meetings. He only belongs because compelled. A few men run the meetings, run the unions and bring on all the labor wars. The few gain by it; the many suffer.

This condition of things should no longer be tolerated. The boycott should be stopped. The citizens of the State hold this evil in the hollow of their hands. Let them declare against the boycott and it is doomed. Watch your employees and discharge boycotters. Patronize boycotted firms. When boycotting becomes dangerous, and boycotts help more than they harm, boycotting will cease.

How Society is Indebted to Invention.

In the "Relation of Invention to the Conditions of Life," in the *Cosmopolitan Magazine*, Mr. G. H. Knight says:

With each step in industrial progress not only is the greater the number who can be warmed, fed and clothed, and the better are their life conditions, but in default of such progress a vast majority would not have lived at all. It is to industry, guided by scientific methods, and to science that concerns itself with practical applications of its discoveries, that we are indebted for such magical arts as that which makes light itself depict for posterity the very features and expressions of the life it once illuminated; for the kindred art whereby scenes in the most remote regions are made to pass in realistic panorama before the pleasantly cheated vision; for the instrument which, having analyzed the sunbeam and revealed the chemical constituents of distant constellations, becomes, in the hands of the metallurgist, the means of determining the precise instant at which to arrest the process of "conversion" in the Bessemer steel manufacture. It is to invention that society is indebted, not alone for the refinements, but for every necessary of modern life; for food, clothing, and shelter; for the arts of spoken, written and printed speech; for the means of flashing the very voice to a listener in a distant city, or catching the fugitive, tremulous tones and storing them for the delectation of generations yet unborn; for music, poetry, and the plastic arts; for locomotion by land, by sea, and even through the circumambient air; for the gift of soothing with healing wings the bed of anguish; for the ability from this tiny speck of earthly life to sound the abysses of time, thought and space.

It is estimated that about 30,000 horses were ousted from street-car service last year by electricity.

How They Measure Electricity.

Consumers of electric light have frequently wondered how the ingenuity of man has succeeded in measuring the amount of electricity used in stores and private dwellings. With all the investigations and discoveries made, electricity is still something enveloped in mystery, and its use is still to a great extent empiric. Open one of the meters and you will find that it consists of two compartments; in the upper you will find a thin piece of German silver running in a zig-zag line across the compartment; in the lower compartment, separated from the upper by a bar, the latter being a part of the cast-iron construction of the meter, there is a spool of copper wire and a bottle; in the latter there are two pieces of zinc separated from each other by a piece of rubber. These three things constitute the meter. Some meters contain two of each kind, and are called double meters, being capable of doing double the work done by a single meter.

The principle underlying the measuring of electricity is that of electroplating, says the *Manufacturers Gazette*. The latter is done by means of an electric battery, a piece of copper being placed in the battery on the positive pole or wire, and the object to be plated being placed on the negative wire. By the action of the electricity the copper is eaten away from the positive wire and fastened to the opposite wire. In the electric light meter two pieces of zinc are used; this zinc must be chemically pure, in order that the measurements may be perfectly correct. These two pieces of zinc are separated by rubber and joined by rubber bolts, so that they may be near each other, and still not permit of passing of the electric current.

One piece represents the positive pole, the other the negative pole. Now the more electricity passes through these pieces of zinc the more zinc will be taken from the positive to the negative pole, so that if enough electricity is used in course of time all the zinc would be on one pole. Here you have the principle of measuring electricity. After the pieces of zinc have been in operation for some time, one will weigh more than the other, and it is just a matter of mathematical calculation how much is charged, the charge being relative to the amount of zinc decomposed.

But if the bottles were all that was used for the measuring of electricity, it would require a bottle the size of a house to measure the electricity used in the average residence or store, and the consumption of zinc would be something enormous. It is for this purpose that the piece of German silver is used, this metal being selected as best fitted for the purpose. This piece of metal is called a shut, because it shuts off most of the electricity and prevents it from going through the bottle. This piece of metal is so accurately adjusted that it takes just 999 parts of electricity to one which passes through the bottle. The electricity from the electric light wire, before it goes to the lamps, passes through the meter; here one-thousandth part passes through the bottle with its pieces of zinc, the rest being shunted off through the German silver. It is on this account that the size of the bottle may be reduced to small dimensions.

The spool of copper wire is fixed between the wire and bottle. When the solution of sulphate of zinc contained in the bottle gets too warm, it permits more electricity to pass through it than the one-thousandth part of the whole. At the same time the increase in temperature would have an opposite effect on the German silver, and less would pass through. This would result in a very heavy registering, the amount of zinc consumed being proportionally large, and would be an injustice to the consumer. In order to avoid this the spool of copper wire is used; when the bottle gets too warm, the copper wire is similarly affected. The copper does not permit the bottle to gobble up all the electricity it would like, and thus acts as a regulator.

It will be seen that the measuring of electricity depends on the most carefully adjusted mechanism. As a matter of fact, the weighing of the zinc negative plate is the more delicate. During the last days of the month, employees of the Edison Company go about among the customers of the company, gathering in all the bottles and replacing them by others. These bottles are all carefully marked and taken to the office of the company. Here the pieces of zinc are separated, and the negative pieces, which are indicated by being opposite to where the head of the rubber bolt is, are carefully washed and then permitted to dry.

After this their record is looked up, and the operator knows just in a milligramme how much a h piece of zinc weighed before it left the works and was put in the meter.

On one of the most nicely adjusted scales the zinc is weighed, and the difference in its weight noted down. This decrease of weight is multiplied by a figure known as the constant, and the result is the bill of the consumer in dollars and cents. Of course, the zinc removed from the positive pole is deposited on the negative, and the amount of electricity used might be ascertained by weighing the negative piece and noting the increase in weight; but this would not be accurate, as some of the zinc in process of being transferred from pole to pole is lost in the solution. Besides that, to determine the amount of electricity used in this way would give way to fraud on the part of a few consumers who understand electricity. There is no likelihood of their scraping the positive pole, for the more they scrape it the higher would their bill be.

It is but natural that only the most nicely adjusted scales can be used in the weighing of these pieces of zinc. In the first place, before the weighing is done, every door and window is closed, although the weighing is done in an inside room. The least bit of air would add several dollars to some consumer's bill. Then the scales are covered with glass, and it is only when the piece of zinc has been placed on the scales and the glass lowered that the weighing is proceeded with.

Differential Staining with Eosin.

At the last meeting of the San Francisco Microscopical Society, a paper was read by R. H. Freund on "The Differential Staining of Cover-glass Preparations by Eosin." He said aniline dyes were of two groups—the basic and the acid. To the first belonged methyl-violet, gentian-violet, methyl-blue, vesuvium, fuchsin, and a number of others. To the second group belonged the derivatives of the fluorescein group—eosin, methyl-eosin, cocein, pyrosin and aurantia. Koch and Weigert have used the selective affinity of the basic colors for staining and differentiating bacteria, and taking Koch's researches as the base, Ehrlich has succeeded in utilizing them in staining and differentiating the cellular elements of the blood. He gave his method the name of the Tinctorial or Color analysis, asserting that certain dyes under all conditions produced invariably the same effect on some cell elements, with the certainty of a chemical experiment; in fact he claimed that the result obtained was a chemical compound formed between the dye and the object brought in contact with it.

A number of years ago, Waldeyer (*Archiv für Mikroskopische Anatomie XI*) observed that on different places on the loose connective tissue are to be found large, round, coarsely granular cells which he called embryonal or plasma cells. He asserted that these cells had a disposition to absorb fat, and that in time they might degenerate into fat cells. Investigating Waldeyer's observations, Ehrlich found that these cells have a disposition to absorb and retain certain aniline colors; and following up his experiments, he found that an analogous reaction takes place with certain granular elements of the blood. That Ehrlich's researches are not better known is due to the fact that until last year his published observations were scattered through the different medical journals; but now he has collected them into a volume, "The Histology and Clinic of the Blood and Relations to Color Analysis."

Mr. Freund's paper gave a very careful resume of the subject, and he explained to his hearers his own method of preparing, staining and mounting blood. His paper was further illustrated by a number of preparations shown under microscopic amplification of 1,200 to 2,000 diameters. Among these were two beautiful slides prepared by Dr. Bein of Berlin.

After the reading of the paper an interesting discussion took place, in which Dr. Wythe, Dr. Sanderson and others took part. It was asked whether any *ante mortem* treatment of the blood would facilitate its study, to which Dr. Wythe replied that a guinea pig could be fed for weeks with sulpho-carbolate of soda in its food, and when killed, the blood could be treated with numerous reactionary elements, which would yield beautiful and permanent stains.

THE VALLECITOS OIL FIELDS.—Recent developments show a decided improvement in the quality and quantity of oil from the San Carlos Oil Company's well No. 1 in the Vallecitos oil fields in San Benito county. Recent tests show an annual put of 3000 gallons per day, 76 per cent of it being a rare quality of lubricating oil, very valuable in the market. Several 800-foot wells will be bored at once by the company. The development is creating great excitement in the country.

Gold and Silver in the United States in 1891.

The following is an abstract of the report of Hon. E. O. Leech, Director of the U. S. Mint, for the calendar year 1891.

The product of gold from the mines of the United States aggregated 1,604,840 fine ounces, of the value of \$33,175,000. This is an increase of \$330,000 over the product of the previous calendar year. The increased product is due largely to improved processes of treatment and to the increased amount of gold extracted from lead and copper ores.

The product of silver from our own mines was 58,330,000 fine ounces, of the commercial value of \$57,630,040, or of the coining value in silver dollars of \$75,416,565. This is an increase of 3,830,000 ounces over the previous year. The increased silver product was due principally to new finds in Colorado and Idaho and to the cheapening of the process of smelting lead and copper ore bearing silver.

The Director of the Mint has made a special effort to distribute for the first time the silver product of the United States as to the sources of production. He estimates that of the total product for the last calendar year 28,497,000 fine ounces was produced from quartz and milling ores, 29,707,000 from lead ores and 6,126,000 from copper ores; total silver output, 58,330,000 fine ounces.

The total product of Government and private refineries in the United States, including foreign material smelted and refined, was: Gold, 2,169,863 fine ounces; silver, 69,336,415 fine ounces.

The total value of the gold deposited at the mints during the year was \$70,915,632, of which \$24,853,180 was foreign coin and bullion. The deposits and purchases of silver aggregated 73,088,626 standard ounces, of the coining value of \$85,048,584.

The amount of silver purchased by the Government during the year was 54,393,912 fine ounces, costing \$53,796,833. The average cost of the silver purchased during the year was \$0.989 per fine ounce. The average cost of the total amount purchased under the act of July 14th, 1890, has been \$1.02 per fine ounce.

The price of silver at the commencement of the calendar year 1891, was \$105 per fine ounce, and the close, December 31st, was \$0.955 per fine ounce. The average price for the calendar year was \$0.99 per fine ounce.

At the date of the passage of the act of July 14th, 1890, the price of silver was \$1.74 per fine ounce; at the date the law went into effect it had advanced to \$1.13. The highest point touched was on August 19th, 1890, \$1.21 per fine ounce. The lowest point touched was on March 28th, 1892, \$0.85½ per fine ounce.

At the lowest price of silver during the year the commercial value of the pure silver contained in the silver dollar was \$0.73¾; at the highest price, \$0.826, and at the average price \$0.764. At the price of silver March 28th, 1892, the commercial value of the pure silver dollar was \$0.66.

The coinage of the mints during the calendar year 1891 was as follows:

Description.	Pieces.	Value.
Gold.....	1,770,620	\$29,222,005 00
Silver Dollars.....	23,562,785	23,562,785 00
Subsidiary silver coins.....	20,451,916	3,956,121 60
Minor coins.....	63,906,700	1,312,441 00
Total.....	118,691,971	\$58,053,302 60

In addition to the coinage gold and silver bars were manufactured as follows: Gold, \$87,865,473; silver, \$6,979,510; total, \$44,844,983.

Gold bars were exchanged for gold coin, for use in the industrial arts, of the value of \$12,495,094.

The imports of gold aggregated \$45,298,928; the exports of gold, \$79,187,499; net loss of gold, \$33,888,571. The imports of silver aggregated \$27,910,193; the exports of silver, \$28,783,393; excess of exports over imports, \$873,200.

The value of the precious metals used in the industrial arts in the United States during the year was: Gold \$19,700,000; silver, \$9,630,000; total \$29,330,000, of which \$10,697,679 gold and \$7,289,073 silver, consisted of new bullion.

WORLD'S PRODUCT OF GOLD AND SILVER.

The product of gold and silver in the world for the calendar years 1889, 1890 and 1891 was as follows:

	Gold.	Fine ounces.	Value.
1889.....	\$123,398,000	123,205,000	
1890.....	119,464,000	132,833,000	
1891.....	124,229,000	140,865,000	
	Silver.	Coining value.	
1889.....	\$115,197,000	\$159,295,000	
1890.....	139,475,000	171,744,000	
1891.....	139,175,000	182,129,000	

The product of gold increased in 1891

over the prior year nearly \$5,000,000, the increase being principally in South Africa. The product of silver increased in 1891 over the prior year about 8,000,000 fine ounces.

Bits of Practical Experience.

Many of our readers have bits of practical experience in locating and overcoming difficulties in the engine-room or about the plant, or in erecting work, which would be of the greatest interest to our readers if clearly described; and they could advance their own interests as well as offer good suggestions to their young brother engineers by writing out a statement of the facts for publication. It is by an exchange of ideas that we become the better posted and more able to deal with the contingencies which occur in practical engineering. Many engineers, while admitting that they have encountered problems which have bothered them for a long time, but which they finally overcome in a simple and practical manner, often say, when asked to write out a statement of the same for publication: "Oh, I am an engineer and not a writer. I can tell these things to you all right, but I can't write them out so they would look well in print." To such we wish to say, if you have anything of general interest or practical importance, write and tell it to us in your own way, and we will try and make it read all right when it appears in the paper. Other engineers, after telling of how they located and overcome difficulties, will say, when asked to write it out for publication, "Oh, what's the use, all the engineers know it." All the engineers do not know it, and there are plenty of young men struggling along, trying to become proficient in their business, who would be only too well pleased to read of these little things that "all engineers know." So, boys, send in your little communications, and tell us how you did this, that or the other thing, as all such statements are pointers, and serve to help along the young engineer. A case or two which will illustrate may be given:

An engineer, while cleaning out his furnace, noticed an accumulation of soot on the boiler wall high on the side. It had a plumelike appearance, the stem of the plume being upward. This excited his curiosity, because the tendency of draught was such that the formation should have pointed in the opposite direction. This indicated to his observing mind that something was wrong in that locality, but nothing could be seen which might have caused it. Investigation proved that there was a crack in the sheet, and a small jet of water blowing through had produced a current against that of the air and gases caused by the draught, and the moisture striking the wall had carried soot with it and deposited it, forming the beautiful black plume he had noticed. Here a little observation and the ability to study from effect to cause had called his attention to what might possibly have resulted in a rupture of the boiler, if not attended to in time.

In another case an iron smokestack blew down during the night, and as the top of the boiler-house was 16 feet from the ground, and not strong enough to support a derrick, it became a question how to get that stack back in place, and in the shortest space of time possible. As the engine-house was at some distance from any town or base of supplies, the problem was of some importance.

To engineers of extensive experience there would be no particular difficulty in either of the above cases, but the young engineer, whose experience is limited, would derive benefit from a description of the indications, the investigation and the method employed in making the repairs. Practical, everyday engineering includes many little points which call for the exercise of ingenuity more than the application of experience.—Stationary Engineer.

A BIG MINING SUIT.—The case of the Consolidated Wyoming Gold Mining Company vs. the Champion Mining Company, involving the ownership of the Ural and Wyoming quartz mines, has been transferred from the Superior Court of Nevada to the United States Circuit Court. Two hundred thousand dollars damages are asked for the sinking of a shaft and the carrying away of 20,000 tons of ore; also an order enjoining the Champion Company from further trespassing.

PROFESSOR ELIHU THOMPSON, in a recent article, states his belief that 130,000 horse power at 500,000 volts can be transmitted 240 miles through three wires about as large as a good-sized knitting needle, and, moreover, that this can be sent underground through a small pipe, using only cotton and cheap oil as an insulator.

Prospecting in Fresno.

This is not essentially a mining county. It is an agricultural and fruit-growing region; but among the hills and in the gulches of the Sierra Nevada there are hundreds of small claims, no one of which represents a large fortune, but when taken in the aggregate they all amount to a considerable.

There are hundreds of old miners in this county who still feel sure that there yet remain to be discovered mines as rich as any ever discovered in the past. Somehow, the idea seems to have a strong resting place with men who have followed this pursuit, that the best and the greatest mine of all yet remains to be discovered; and many a man spends a part of each summer searching for the "mother lode," as it is called.

IT MAY BE DISCOVERED.

There is no reason why such a ledge may not be discovered. Geologists are of the opinion that such a ledge exists somewhere in the Sierra Nevada mountains, and that all trace of its appearance on the surface was ground away by the action of glaciers during the epochs of ice.

If this was so, the ledge exists somewhere beneath the debris and soil of the mountains, and sometime, it may be, an old miner of '49 will discover the object of his dreams, and enough gold will be found in that one mine to make the world rich forever.

THIS SEASON.

As soon as the snows melt in the lower mountains this spring, there are many persons ready to go into the hills on prospecting tours, searching for new mines and working old ones. It is the regular summer work of many people. It is a sort of vacation, sometimes profitable and always pleasing. There is always a prospect of making some great discovery; and the labor is of a pleasant sort and reminds the laborer of the time when he had nothing to do when he wanted money but to go and dig for it in the ground and get all he needed.—Fresno Examiner.

CRYSTAL SALT.—On Monday the Directors of the Crystal Salt Company moved the principal place of business to Colusa. Wells are being sunk, vats built and other work done to develop the business. The works are three miles north of Siles. Water will be pumped into a lake covering some 10 to 15 acres, and drawn off into vats after it has become almost strong enough to begin to form salt. In addition to the employment of solar heat in making the salt, the natural gas that is found in great abundance will be used. The solar heat will be put in operation first. The supply of gas is inexhaustible, as well as the supply of water from 15 to 40 per cent salt, the sea being only three per cent. The salt, when made, is some three per cent purer than any other salt known to commerce. The bittern, or the water left after it has quit making salt, has from 20 to 30 grains of iodine to the gallon. This is stronger in iodine than any known water. The iodine is freed from the other substances by distillation, and the natural gas will furnish the fuel for that. The outlook for the company is splendid.—Colusa Sun.

THE NEW CALEDONIAN NICKEL MINES.

—The Societe du Nickel, which operates the extensive nickel mines of New Caledonia, has taken a novel step in introducing Japanese labourers for the purpose of working its mines. The company has hitherto been seriously hampered in its operations through the difficulty in securing efficient labour, and finally, having obtained authorization to employ Japanese, a colony of 600 has already been brought to the island. Notwithstanding the trouble experienced from the before-mentioned cause, the report of the Societe du Nickel for the past fiscal year shows a very satisfactory return from its mines; and it is anticipated that the present year will show a considerable increase, new and favourable arrangements for the shipment of the matte to Europe having been made.

ELECTRICAL LOCOMOTIVES.—The Boston correspondent of the *Electrical World* says that the electric locomotive which is being built in factory L. at the Thomson-Houston Electric Company's works, at Lynn, is rapidly approaching completion. It will be a monster in its way, of some 500 h. p., and destined to take the place of a steam engine on a railroad for pulling either passenger or baggage cars. The electric locomotive is sure to grow, the tendency being very much in this direction, as a prominent official of the Northern Pacific Railroad Company said not long ago that this road would be run by electricity inside of three years. If so, it is probable that the locomotives will be furnished by the Thomson-Houston Company.

Fibre-Graphite.

Fibre-graphite is a new anti-friction material that has very recently come into general use. It was invented some two years ago and is very rapidly acquiring prominence as an antifriction material for journal bearings, because of its very valuable property of doing away with all oil as a friction-reducing agent, thus eliminating from all machinery plants a very considerable item of expense. Fibre-graphite is composed of two materials, hard wood fibre and graphite. It is manufactured by the following process: Hard wood fibre is reduced to a pulp, graphite is then added in a powdered state, and this material is taken to the mold, which consists of an iron box or tub, with several very small holes in the bottom. The wood fibre and graphite are placed in this mold, water is added and hydraulic pressure is applied. The pressure causes the water to escape by the holes in the bottom of the mold, and in its escape it causes the wood fibre to take a perpendicular position, and as the wood fibre prevents the graphite from escaping, the latter is compressed between the fibres which are themselves coated with graphite, and the result is a dense mass of fibre-graphite. It can be pressed to any density, making it capable of standing any pressure brought to bear upon it. When taken from the mold the material is in a finished condition and has a very smooth surface of a satin-like appearance. After being removed from the mold it is dried in the atmosphere for a short time, after which it is thoroughly saturated with purified linseed oil and baked in an oven. This last operation leaves the material ready for use. The wood fibre in taking a perpendicular position, present the ends of the fibres to the shaft, thus reducing the wear on the journal. In the form of a journal-bearing, fibre-graphite is a solid lubricant, graphite being one of the best lubricants known. The first few turns of a shaft in a fibre-graphite journal, fills the pores of the steel and also gives the shaft a very thin coating of fibre-graphite. This coating, together with the fibre-graphite journal box, make a perfect bearing of antifriction material. This material has passed its experimental state and is now being rapidly manufactured, principally into journal bearings. The inventor, Mr. Holmes, has been awarded a gold medal by the Franklin Institute of Philadelphia. Its uses are manifold, its great advantage being the abolishment of oil. For electrical uses, exclusive of bearings for dynamos and motors, it has met with very great success as a dynamo brush. It has the same conductivity of carbon, never cuts the commutator, and, being a lubricant, wears itself to a perfect bearing on the commutator. For textile purposes it is also beginning to be very much used, textile work having in its winding and spinning machinery, hundreds of small bearings to which it is almost impossible to attend, and for which, by substituting fibre-graphite, no attention whatever is needed.—Electricity.

THE WORLD'S SUBMARINE CABLES.—A statistician has computed that there are at present in the world, under State management, 13,179 miles of submarine cables, with 19,426 miles of wire; and in the possession of private companies, 112,937 miles of cable, with 113,885 miles of wire, being a total, therefore, of 126,116 miles of cable with 133,311 miles of wire. These cables are all in operation, besides which there are several long and short lines in course of construction. Of the lines under State management, Great Britain is credited with 4010 miles, with 7685 miles of wire; France with 3969 miles, with 4486 miles of wire; Germany with 1580 miles, with 2877 miles of wire; Italy with 1072 miles, with 1092 miles of wire, and other countries with 2592 miles, with 3780 miles of wire. Concessions are not now granted in Germany to private companies, which, however, flourish in Great Britain, France, the United States, Denmark, and the Argentine Republic. The miles given are, in every case, nautical miles of 6,086.7 feet.

THEY PAID THE DIVIDEND.—While overhauling some old papers the other day, A. W. Havens, Secretary of the Con. California & Virginia Mining Co., found a small slip of paper, which is of great interest. It was a memorandum of the amount of money on hand in the treasury of the old Con. Virginia Mining Co. on June 5, 1876. The Directors had requested Mr. Haven to furnish them with these figures on that day, as they wished to see whether there was enough coin on hand to declare a dividend. The showing was as follows: Cash in Nevada Bank, \$2,197,769.07; unsold bullion, \$2,007,075.48; total on hand, \$4,204,844.55. It is needless to say that upon this showing the Directors declared a dividend.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

GOVER.—Amador Ledger, May 7: We are in receipt of a communication from the managers of the Gover, saying that the article in our last issue concerning an alleged cave in the mine is incorrect; that there was merely a settling of ground in the old works, which in no way interferes with the running of the mill; that no ground has been lost and, furthermore, that the future of the property is very promising. All of which we are pleased to hear.

MISCELLANEOUS.—The Grass Valley hydraulic claim is cleaning up. Twelve men are employed, and two guards watch the property day and night. It is expected that the run has been very satisfactory, and the cleanup is expected to reach at least \$20,000. L. Ludekens is washing some pay dirt on his claim, adjoining the Grass Valley hydraulic mine. It is turning out something like \$10 or \$12 per day. A. W. Kimball has shipped some of the ore from his rich claim in Pioneer district to San Francisco for treatment. It is claimed that the ore will assay on an average \$100 per ton, and that it cannot be worked to advantage in this county.

SUTTER CREEK.—Everything at the Hector mine has settled down to its former quiet attitude, and taking out water has been resumed. They have already got down to where they left off, and if they can continue at the rate they have been going, no doubt they will reach the 200-foot level inside of the next two weeks, when the taking of ore will be inaugurated as soon as possible, in order to pay expenses as developments progress. All revenue was stopped when the dynamite explosion happened, and whereas the mine was then in fact on a paying basis, the company will now have to go into their pockets until they get to ore in the 200-foot level. Mr. Finch, one of the owners, has been up from the city for several days, helping Mr. Valentine look after matters, and they have concluded to explore the mine to a considerable extent. The pump is finished in the South Eureka, and crosscutting has commenced in earnest. They expect to strike a ledge in a short distance, and they feel confident that it will be of a paying character. The Lincoln still continues to run on a slim scale. At the Belmont things are looking encouraging for a permanent mine. Martin Jones, the president of the company, is up and is perfectly satisfied with the way Mr. Tibbitts, the superintendent, is managing the mine, and contemplates putting in improved hoisting power in the near future. They have about a dozen men on the pay roll with a prospect of increasing the number before long.

PLYMOUTH.—Amador Record, May 5: A Plymouth correspondent informs us that there is considerable rejoicing at that place over the fact that operations will be resumed at the Plymouth Consolidated mine again right away. Report has it that there will be more men put to work there than has been employed for some time past. It is to be hoped that this good news will be verified.

CLINTON CONSOLIDATED.—Our Weiland correspondent writes that the Clinton Consolidated Co. started its air compressor, which was recently put in by David Fisher, on the 18th ult., and that it works satisfactorily. The compressor is an Ingersoll, and with 80 inches of water runs three Ingersoll-Sergeant drills of 34 inch cylinders. The mill is crushing 100 tons of ore daily.

Butte.

ANOTHER MILL.—Palermo Progress, May 4: Hay & Clark will soon put in extensive mining machinery at their Bangor mine. They have purchased a 20-stamp mill from a company which formerly worked the Mineral Slide near Paradise. The mill and its equipments are rather bulky, and it will be several weeks before much headway is made toward moving them. They are at present near the base of a steep incline, and a new road will have to be built before they can be moved to the top of this. A new engine has also been purchased for the mine, which will shortly arrive from the city and which will be used for pumping as well as for running the mill and other machinery. Messrs. Hay & Clark will shortly take up their permanent residence at Bangor in order to be near the seat of their operations and superintend things for themselves. Milt Sheets has been permanently engaged as their engineer.

DAIRING.—Oroville Register, May 5: On the west branch of the Feather river, just below Magalia, is the Wright Durgan property, now exciting considerable attention. For choice of location and rich promises it is unequalled in that vicinity. Superintendent Lewis, formerly of the Butte Queen mine, has organized the Durgan property, with a view to permanent and substantial returns. From the first it has given every indication of worth. Their fine dumps and flumes are now completed, and some 20 men are engaged in drifting. The gravel is inviting and prospects fine. Commencing at the old Daniels place, we find in this same section the Mossback mine, owned by H. R. Benning. Associated with him are Messrs. Knox, Hendricks and Lambert. They are now in pay dirt, having completed 140 feet of bedrock tunnel. Meantime they have bonded and will doubtless purchase a large extent of this channel, some say a stretch of two miles, with a view to more extensive operations. On Little Butte Creek, below Nimshe, there is a very decided flurry of excitement. The mines in that section are known to be very rich and have heretofore furnished a living for any number of easy going miners who are quite satisfied with "sufficient unto the day."

No man has ever doubted the large wealth of this section, and one of the best evidences is the immense banks of tailings, representing past labor, to be seen thrown out all the way from Centerville to Nimshe. All these have a gravity drainage, in itself a valuable feature. Then the gold is generally coarse and of an extremely fine quality. Messrs. Proud and Hemsley have opened the old Kirkwood at this point, or rather are arranging preliminaries to that end. Some twelve miles southeast of old Lovelocks, at the junction of the Little and Big Kimshe, lies the Lindsey Bar mine. Mr. Spencer, the manager, and Anderson, the foreman, are both men of fine experience in their line. They are associated with three or four other gentlemen, with a view of cutting through the lower rim of the channel under the creek, and thus draining the bedrock. To this end they have over 100 feet of 7x8 tunneling complete, with a double compartment flume which will entirely extend through the tunnel to carry off the debris. This piece of work will be completed by June 1st, preparatory to a fine business during the summer. Just above this point, on the Little Kimshe, is Ramsey's Bar. Here a snug little company of seven, mutually interested, are driving ahead. "Prospects good or wouldn't stay, you bet," said one bright-eyed fellow. North and east of these are the Snow mines. These have always paid well, and, I am told, are yielding good dividends now.

El Dorado.

CYANIDE PROCESS.—El Dorado Republican, May 5: The owners of the Pyramid mine at Green Valley have under consideration the cyanide process on their ore. The Pyramid has one of the largest bodies of quartz in the county, and tests of the ore made by the proprietors lead them to believe that if it is properly handled, the mine will become exceedingly valuable. There has, so far, been much difficulty in amalgamating and saving the gold.

SLATA.—During the week a number of parties from a distance have been inspecting the slate veins that have been opened by the "Big Tunnel," near Placerville, and negotiating for the purchase of the property. They are satisfied with the appearance of the slate, and old quarymen pronounce it the finest they have ever seen.

Kern.

OLD MINES REOPENED.—Bakersfield Californian, May 5: W. J. Graham, of Havilah, has leased the Russian Bear and other mines at Glen Olive, belonging to Palmer & Co., of San Francisco, with an option of purchase. He now has five men at work, with fair prospects, and contemplates soon moving his Huntington mill from Havilah to the new camp. If the mill proves as good a gold saver as it was in Havilah, there is no question but that Mr. Graham's enterprise will result in making a lively and prosperous camp at Glen Olive, or "Topside," as it was first named. The vines there are massive, easily worked, and require very little timbering, and while the quartz is chiefly low grade, there is a great deal of rock rich in gold. The trouble with the first company which worked mines there, and in fact opened the district and started the camp, seemed to be that the gold could not be saved. The quartz prospected handsomely in gold, but was heavily sulphuretted, and somehow, especially in the early runs, gave no satisfactory returns whatever, greatly to the disappointment and loss of the owners. Inasmuch as the Huntington mill, in Havilah, has beaten stamp mill returns with every lot of quartz crushed, the hope is permissible that it will go to a. Glen Olive, in which event handsome results are sure.

Modoc.

MINING DISCOVERY.—Alturas Herald, May 4: That the range of mountains east and north of Alturas contains gold and silver bearing ore can no longer be disputed. For several months past, prospecting has been going on steadily from Willow ranch, in Goose Lake valley, to Lake City over in Surprise valley, and the result has been that an immense body of ore has been discovered which is likely to prove a veritable bonanza for the discoverers and Modoc county in general. Over in Surprise valley the ledge crops out on the mountain side over a hundred feet in width. In fact, the entire mountain is one mass of ore. The rock so far tested has proved that it contains gold, silver and some kind of metal which resembles nickel. The ranchers in that neighborhood are the lucky owners of this valuable find. Mr. W. J. Dyson, an old time assayer, is the gentleman who made the discovery, and Ralph Nesham, an old California miner, has since been working on different parts of the vein running tunnels and sinking shafts. Mr. Nesham built a furnace, and is at present roasting the ore endeavoring to find out where the richest rock in the vein is located. Samples of this ore have been sent out to various assayers on the outside, and the returns have always been very encouraging. We believe that in the near future Modoc will produce as much gold and silver as the neighboring counties surrounding her.

Nevada.

NEGOTIATIONS FOR A MINE.—Grass Valley Telegraph, May 5: We understand that there is a proposition being discussed between the Maryland Mining Company and the Idaho Company relating to the purchase by the Maryland of the Idaho ground and all the machinery of the latter company. The Maryland's ground adjoins the Idaho property on the east, and the Maryland can be worked through the Idaho's openings. The sum of money involved in this proposition is a good big amount. There is no certainty at present that the trade will be made.

THE DERBEC DRIFT MINE.—Transcript, May 5: At the Derbec mine 85 men are employed this month, being 25 less than were at work in April, when an extra force was required in washing over a large quantity of tailings, which

yield good returns. New ground is being opened as fast as the drifts can be run, and the property is in a fine condition all through. The Derbec is one of the best drift mines in the State, and there are many more places in Nevada county where equally good ones could be opened if capitalists only had the nerve and good judgment to prospect for them.

THE NEW PUMP AT PEABODY.—Grass Valley Union, May 7: The new 12-inch pump, which was manufactured by C. M. Taylor, and is a splendid piece of machinery, is placed in the Peabody mine, and is operating successfully. The pumps previously in use were not capable of handling all the water to advantage, and, for that reason, underground work has been greatly hindered of late.

San Bernardino.

THE MINES AROUND BANNING.—Herald, May 3: From mining prospectors who have been coming in from the desert for supplies during the past few days, we learn that there is considerable activity in the desert mining camps. W. H. Alesworth, who, with Mr. Rae of Los Angeles, has received an option on the Carlisle mine, near the old Virginia Dale mine, reports that good progress is being made in his mine. The ore now assays \$20 to \$100 per ton at 40 feet, but prospects are growing better. A mill will probably be put up and a camp opened on this property this summer. Johnny Noble, another prospector of San Jacinto, returned Friday from a trip to Rattlesnake canyon, about 25 miles northwest of Salton, and brought back some excellent specimens, one of which weighed in the neighborhood of \$30. The mines there are owned by Messrs. Stuttenfeld, Brown and others, of San Bernardino, and a mill will probably be put up there in a few months. Prospectors there find plenty of water and good feed for stock. John Wilson came in from the Twenty-nine Palm country last week, and reported that the company interested in the mines there are putting up a Bryar mill and concentrator on their property, and expect to have it in running order about the middle of June, when a large force of men will be put to work. Mines are showing up in good shape in the Twenty-nine Palm country, and the district is being thoroughly prospected. We learn from parties from San Jacinto that a mill will probably be erected at Tingman's mine, on San Jacinto mountain. Altogether, mining districts tributary to Banning have a bright prospect. Messrs. Atkin and McGraff, the men who discovered the Eagle Mountain mine, were in town last Friday. They state that they had run out of water at the mine. While excavating for a reservoir they struck a pocket of free gold which yielded \$700. The Eagle Mountain was sold for \$20,000 some time ago.

AT THE TIN MINES.—Los Angeles Express, May 5: The tin mines are to be more rapidly developed by the addition of new machinery just received. Compressed air will soon be used to drive the underground works, instead of pick and shovel. Gervaise Purcell, of Los Angeles, became general superintendent on Monday, and it is expected that he will be able to push matters more rapidly. Captain Harris remains in charge of the men, with Mr. Stevens as purser.

Shasta.

IRON MOUNTAIN.—Shasta Co. Democrat, May 4: Negotiations are pending for a sale of gold, silver and iron properties north and east of the famous Iron Mountain, which include the Hornet, Little Nellie, Mose Drew, Adaline, Ben Harrison, E. E., Little Nellie No. 2, Miers' Pride, Pomona, and Tippecanoe claims, all owned by B. N. Bughey of Sacramento. B. N. Bughey, owner of the Little Nellie mine, has just sent up to the superintendent, J. M. Gleaves, a new first-class assaying outfit. J. M. proposes to classify the ores at the mine, mill certain grades and ship the best to Paul's works for treatment by the MacA. F. cyanide process. Many Shasta county farmers would do well to follow his example. Dan Haskell, formerly of this city, has purchased the Little Maud mining claim from B. N. Bughey. This claim, adjoining the Little Nellie, has been claimed and worked by Dan for several years, but, being located on a railroad section, he concluded to quiet title by purchase rather than by litigation. J. M. Gleaves made the survey last week.

Siskiyou.

TO TUNNEL.—Yreka Journal, May 4: A company of merchants and business men in town have subscribed means for tunneling Humburg mountain, directly west of town, and men are now at work driving the same, under the supervision of T. D. Austin, an old and experienced miner. No doubt good quartz ledges may be discovered, and probably a valuable supply of water. The Humburg range contains many rich ledges at various points, and also springs and small streams, so that a tunnel through the mountain ought to develop valuable finds of both gold and water. The tunnel has been started high up on the hillside, over 300 feet above the level of Yreka.

CINNABAR.—We learn that an eight-foot ledge of very rich cinnabar has just been discovered on the west fork of Beaver creek, not far from the old ledges of the Siskiyou Consolidated Quicksilver Mining Co. on Siskiyou mountain. This company has been expending considerable money in developing the cinnabar lodes of that section, from late assessments levied, and is well fixed with furnaces and the requisite machinery for producing quicksilver from the cinnabar rock taken out, when found in quantity and richness.

BALLARAT.—The Ballarat Mining Co., now sinking a shaft at the old worked-out Chinese hydraulic claim on Spring gulch, just north of Yreka, struck rim rock last Monday at a depth of over 90 feet below the surface, which necessitates drifting toward center of gulch to reach the bottom of same, where rich pay is anticipated. The heavy body of water to contend with makes the work slow and tedious, neces-

sitating constant pumping by steam power and the employment of day and night shifts. The enterprising members of the company are determined to stick to the work until the bedrock bottom in the channel of the gulch is reached, feeling great confidence in meeting with a handsome reward for their persevering efforts. Another monster giant for mining purposes was received here yesterday for the Pinery diggings in Scott Valley, which are now being worked by a San Francisco company, with Mr. Demming as superintendent. This is the second giant received this spring for this mine, which shows that the ground is to be mined on an extensive scale. Geo. Graves showed us a fine specimen of silver ore yesterday, from a pound and a half of which he obtained an ounce of silver. The ledge is fully 25 feet wide, located in Scott Valley, which he intends to make arrangements to prospect thoroughly. If he can get rock that will average 50 ounces to the ton, he thinks he will succeed in making a good stake. Rich specimens of silver ore have also been found on headwaters of Sacramento river in the Trinity range west of Sisson, the ledge being about 20 feet wide.

Tuolumne.

BALD MOUNTAIN.—Sonora Independent, May 7: If the several owners of mines along the western slope of Bald Mountain would form one giant company, each accepting shares pro rata, and then hydraulic the whole face of the mountain, from St. Cyr's ranch to Yankee Hill, we believe it is not too much to say that every man who held a share in the company would be made wealthy. As the mining is now carried on it is very expensive, comparatively speaking. A few get rich, some secure a living and a few make nothing. It would pay to sink individuality and petty jealousies, and let every one acquire wealth by uncovering the immense deposits of gold which every one knows lie hidden in the face of Bald Mountain. Immense pockets have been and still are being found. But they are scattered, and very few indeed search successfully. Let us introduce a new era of mining. Hydraulic the whole hill off. There's millions in it. The present Congress will probably not accord the privileges the hydraulic miners ask, but the matter can be, and should be adjusted. With millions upon millions of dollars of placer gold lying along the face of Bald Mountain, there should be no obstacle of sufficient size to check enterprise. Override everything but the law and justice. There certainly is a way to hydraulic that mountain without injuring the property or rights of any one. Let go of our coat-tails, please, till we hydraulic out a million dollars or so just above Luis Page's tunnel, just to show what may be done.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—Chronicle, May 7: There has been extracted from all parts of the mine during the week 1161 410-2000 tons of ore, of which 368 770-2000 were shipped to the Eureka mill and 792 1600-2000 tons to the Morgan mill. The average assay value of the ore worked at these two mills during the week, 985 tons, was \$21.44. Bullion shipped to the Carson Mint, assay value, \$29,508.16. On the second day of May the Eureka mill was burned down, and since that time our ore has been shipped to the Morgan mill. On account of this disaster, the men in the mine who were engaged in extracting ore were laid off for two days, but have resumed work, as the Morgan mill has commenced working the ore.

OPHIR.—1465 level.—From the mouth of the north drift, from the drift run west from the winze 122 feet below the sill floor of the 1300 level, have continued our work in an easterly direction and extracted some ore therefrom. There have been raised to the surface during the week 16 tons of ore, the average assay value of which is \$29 per ton. From the workings in the Mexican mine, namely, from a crosscut run west from a drift run south from a crosscut run east from the bottom of a winze sunk 101 feet below the sill floor of the 1465 level of that mine, near its southern line, a south drift has been run 14 feet, crossing the Mexican south line and entering the Ophir ground. The face of this south drift is in ore which carries an assay value of \$13 to the ton.

MEXICAN.—On the 1465 level the crosscut running west from the drift run south from the crosscut running east from the bottom of the winze sunk down 101 feet below the sill floor of this level near the south line of the mine, has been extended 14 feet; total length, 43 feet; continuing in a quartz formation, assaying \$5 and \$6 per ton. From this west crosscut at a point 18 feet west from its mouth, a drift has been run south 14 feet, crossing the Mexican south line and entering Ophir ground. The face of this south drift is in ore which carries an assay value of \$18 per ton.

UTAH.—From west crosscut 340 level, at a point 590 feet from the shaft, the north drift has been extended 46 feet; total length, 66 feet; continuing in vein porphyry showing clay separations.

SIEIRA NEVADA.—The joint Sierra Nevada and Union west drift from the shaft, 900 level, is extended a total distance west of shaft of 1930 feet; face in clay and porphyry. The north drift from the Kenosha tunnel is advanced a total distance of 1021 feet; face in porphyry.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, is extended a total distance west of shaft of 1930 feet; face in clay and porphyry.

ANDES.—North drift from west crosscut No. 1, on 420 level, advanced 19 feet and connected with west crosscut No. 2. Work resumed in face of west crosscut No. 3.

BEST & BELCHER.—900 level.—East crosscut No. 1 has been advanced 18 feet through porphyry; total length, 122 feet. In west crosscut No. 1 all work has been on repairs.

GOULD & CUREY.—200 level.—North west drift,

435 feet west of shaft, has been advanced 19 feet; total, 253 feet; face in soft porphyry and stringers of quartz. 400 level—East crosscut No. 1, from northwest drift, has been extended 11 feet through porphyry and quartz; total, 26 feet. Are doing considerable repairing on the 300 and 400 levels. The joint north drift with Savage Company on Sutro tunnel level has been advanced 27 feet; total length, 431 feet; face in porphyry.

HALE & NORCROSS.—On the 900 level are stopping ore from above this level. Winze from this level near our north line was sunk during the week 20 feet; total depth, 85 feet; bottom in quartz and porphyry. Hoisted from this level during the week 162 cars of ore. 1100 level—Started a south drift from end of east crosscut and extended it 20 feet. Stopping ore from above and below this level. During the week hoisted from this level 292 cars of ore. 1300 level—Hoisted during the week 454 cars of ore. Shipped to Brunswick mill 430 540-2000 tons. Average assay of railroad car samples of ore shipped to Brunswick mill for the week, \$23.42; battery assay for the week \$15.90 per ton. Shipped from Brunswick mill to U. S. Mint, Carson, bullion of the assay value of \$12,845.07.

CHOLLAR.—Are doing the usual amount of re-amping on the 450 and 750 levels. The south drift, 1640 level, is out 184 feet south of north line; face in clay and soft porphyry. Extracted and sent to mill in the past week 374 1700-2000 tons of ore from the 930, 1100, 1150 and 1250 levels. Milled during the week 380 tons; on hand at mill, 95 200-2000 tons; average battery assay, \$25.34. The joint northwest drift from 1800 level of the Ward shaft has been cleaned and repaired 150 feet.

ALPHA.—The southwest drift from the 1800 level of the Ward shaft has been retimbered to the north line of the Exchequer.

WARN.—The southwest drift, 1800 level, has been retimbered to the north line of the Exchequer. The joint northwest drift, 1800 level, has been cleaned and repaired 150 feet.

EXCHEQUER.—The joint southwest drift from the 1800 level of the Ward shaft has been retimbered to the north line.

OCCIDENTAL.—The west crosscut from the south drift, 400 level, is in a total distance of 92 feet; face still showing stringers of pay ore. Have started to drift south from said crosscut on a seam of pay ore. The north drift is in 25 feet, face producing some pay ore. The north drift is in 14 feet, face showing \$20 ore.

CON. NEW YORK.—The north drift from the top of the rise from the 650 level is out 58 feet; face in low-grade quartz. During the week have started a north drift on the ledge from No. 4 crosscut, 650 level; face in fair grade ore.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 710 feet; face in clay and porphyry.

Cortez District.

A DRAFT.—Eureka Sentinel, May 7: We learn that, on account of the low price of silver, work upon the Cortez mines has been almost suspended. The mill, which was closed down a few weeks ago on account of a scarcity of wood within reach for fuel, is not to be started up again, and no more ore is to be broken in the mine until silver again comes up to a price that the company may consider sufficiently profitable to resume work. A number of men have been drafted from the mines, and the only work at present continued is in driving a burleigh drift on the 500-foot level. This, it is understood, is being done to keep a few married men in employment. If that be true, a great deal of credit is due to Mr. Wenban, the principal owner and manager, for kind and humane consideration.

Reese River District.

WAGES REDUCED.—Austin Reville, May 5: The Reville is informed by Superintendent Earles of the Anstin Mining Company that miners' wages will be reduced to \$3 per day to-day. This reduction is necessitated by the great discount on silver, as the property cannot be worked unless expenses are reduced. When the price of silver goes above a dollar an ounce, wages will be increased. Austin is 90 miles south of Battle Mountain, and nearly all the necessities of life are high, but men must work for what are called low wages there and the mines will close.

Eureka District.

ORE SHIPMENTS.—Sentinel, May 5: The Eureka & Palisade Railroad Company received for shipment to Salt Lake during the month of April, 1615 tons of ore from the mines of this district, as follows: From the Eureka Con. mine, 600 tons; Diamond, 359 tons; Bullwhacker, 270 tons; Richmond, 150 tons; Williamsburg, 60 tons; Jackson, 35 tons; Phenix, 60; and the Mynbeer, 21 tons. From Paul Bros., lessees, Hamilton, White Pine county, 10 tons. Owing to heavy snowstorms and bad roads, shipments from the Diamond mine for April were light. There is a large quantity of ore at the mine already sacked, and the teams are hauling at the rate of 30 tons per day. The Bullwhacker mine is not looking well, and the shipments from there for May will, it is expected, be light. If the roads remain in their present condition, the Hamburg Company will probably ship 200 tons and the Ruby-Dunderberg Company about 150 tons, and the total ore shipments for the month of May will probably reach 2300 tons. A new ore bin is in course of construction at the Diamond mine. This is intended to give more room for ore, which is often required. The lessees of the Eureka Con. dump are well equipped for jiggling the furnace products, and are making fair wages.

BRITISH COLUMBIA.

MAKING THE SLOAN DISTRICT ACCESSIBLE.—Nelson Miner, May 3: The Provincial Government, through its local representatives, is making every effort to make the Sloan mining dis-

trict easily accessible. Old trails are being repaired, new ones constructed and others projected. To better carry out the work, Gold Commissioner Fitzstubbbs made a trip to the mouth of Carpenter Creek and personally instructed the foremen as to what was wanted and what was expected of them. Twelve men are now at work cutting the trail up Carpenter Creek, and as many more are employed in completing the old trail from the big creek to the lake and repairing and straightening it between the big creek and the railroad. An appropriation of \$1500 has also been made for a trail from Arrow Lake via Nakusp Creek. The promptness with which the Government acted on the suggestion to survey the townsite at the mouth of Carpenter Creek will also tend to bring about confidence, so much needed in new camps.

INDICATIONS GOOD.—The easiest way to reach the Priest Lake country is from a point on Kootenay river. Fred Sntter, who is well known at Nelson, says the locations in that district are farther north than first reported. The claims are only about eight miles south of the boundary line. He and others intend to do considerable development work this summer and will try and ship out a carload of ore. The country is new, and but little prospecting has been done, but the indications are good.

DAKOTA.

NEW MILL.—Deadwood Review, May 3: It is now practically determined that the Homestake company will shortly commence the erection of a 200-stamp mill in the vicinity of Central. The purchase of the Monitor water right furnishes them sufficient water to operate it, and the company is steadily buying up the various properties on the free gold belt in and around Central. These are even more extensive than the Homestake belt, and, in places, run considerably higher. The veins are overlaid with cement, which carries enough gold to pay for working, and hence the development will not cost anything. The erection of this mill will add greatly to the production of gold in the Black Hills.

The Mine Disaster at Roslyn.

On Tuesday afternoon a terrible explosion occurred on the slope of No. 2 mine at Roslyn, Wash., where are located the great coal mines of the Northern Pacific R. Co. The mines are located 28 miles northwest of Ellensburg, the county seat of Kittitas county. As far as known, some 50 miners lost their lives by the explosion. Relief forces were at once put at work, and many of the bodies have been recovered.

The slope in which the explosion occurred runs from No. 2 down to the point where the proposed shaft will be sunk, and is a couple of thousand feet in length. Seven levels have been worked in the slope.

George Harrison, the acting superintendent, says the works were examined thoroughly every morning by a competent foreman, and reports of the condition of all parts of the mine are placed on a bulletin board at the entrance. If there is any danger, the miners are forbidden to go in until the foreman removes the danger. These haultins are recorded in a book as well as on the board, and these reports are signed daily at noon by the mine boss.

The main slope is 13 feet wide and 2600 feet long, with an average downward pitch of 18 degrees, and double side entries turn away every 300 feet, one being an air course and the other an entry proper. Manways are driven, one on each side of the latter, 50 feet from the slope, leaving a 50-foot solid pillar between them and the slope. There are ways to furnish air and to permit miners to travel to and fro, so that they can keep off the slope, and a large cyclone fan forces air into the slope.

It is too soon to fix the blame of this occurrence where it belongs, but this is of the class of preventable accidents where proper precautions are taken. Of course the men themselves are often to blame for carelessness, but as often the companies are to blame for not adopting all the precautions against firedamp. The presence of gas can be detected, and caution can prevent accidents from its accumulation. We have not had many coal mine accidents on this coast, but then we have not many coal mines. A thorough investigation will doubtless ensue. Whatever the cause, a number of bread winners have been killed and their families left destitute. Funds are being raised for the relief of the widows and children.

HON. WARNER MILLER, president of the Nicaragua Canal Co., will arrive here on Saturday morning from Portland, Oregon. He was received at Seattle, Tacoma and Portland by all the commercial bodies, and has succeeded in getting some very liberal subscriptions to the stock and bonds of the canal company. He will remain here a few days, when he will visit Los Angeles, going from there to Galveston, Texas. From there to St. Louis, to attend the National Nicaragua Canal Convention, to be held June 3d. Nicaragua Canal matters are looking very bright, and the great work will be probably completed in the near future.

The following brief list by telegraph, for April 26 will appear more complete on receipt of mail advices:

California—San Francisco—Josiah H. Tuck, conveyor; William H. Obmen, compound steam engine; John Hammond, railway car; Hans C. Behr, steam engine valve gear; Joseph H. Hoadley, steam generator and portable steam generator; Frank Roller, manufacture of explosives; Richard Schumann, Sacramento, orchard cultivator; William A. Galbraith, San Diego, ratchet washer for bolt nuts; James A. Cole, San Jacinto, plow; Joseph W. Fawkes Sr., Burbank, cultivator; Jacob Price, San Leandro, cotton press.

Notes.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail, on telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FRUIT CARRIER.—George W. Stevens, S. F. No. 474,105. Dated May 3, 1892. This is an improved compartment box or case which is adapted to the transportation of fruits and the protection of each article in a separate cell by itself, with means for ventilation and reinforcing devices for the sections of the carrier. A company has been formed in this city to manufacture this device.

PRUNING IMPLEMENT.—L. J. Gilman, Santa Rosa, assignor of one-half to A. Westrup. No. 474,055. Dated May 3, 1892. This invention relates to that class of pruning shears in which the blade is so arranged as to have what is known as a "draw cut." The object of the invention is to simplify the construction of the shears and to increase their power, durability and general effectiveness.

METHOD OF PREPARING FIGS.—George W. Resmer, Forest Hill, Placer Co. No. 474,099. Dated May 3, 1892. This consists of a novel process of preparing figs, whereby they are reduced to a condition adapting them for subsequent manipulation and by subsequent steps making a complete commercial product or article of manufacture. The object is to provide a fig product with flavor unimpaired, having lasting qualities, easily handled for commerce, ready for use by the housekeeper, and forming a laxative food easily obtainable.

CAR COUPLING.—John C. Look, San Jose. No. 474,090. Dated May 3, 1892. This is one of that class of car couplings known as the "vertical plane," and of that class which has pivoted hook heads and pivoted guards. It has the peculiar merit of being a flat-face hook head in combination with a pivoted guard, whereby the flat-face hook-head coupling is made entirely automatic. It consists of a draw-bar with pivoted hook head and a buffer arm, with a

guard pivoted to the buffer arm, and actuated by a spring from the car to press the guard toward the hook, and to let it yield on coupling with an opposite head. A side spring from the car acts in opposition to the one on the guard, and the two, in connection with a stop, hold the coupling in the required position when the cars are separated. A vertical bolt locks the pivoted head, and a lifting bar is placed underneath the bolt, with chain connection to the side of the car for uncoupling.

News has reached Carson that the final arrangements are being made for the sale of the Inyo canal and the soda works at Keeler to some English capitalists. These properties are new largely owned by Carson people. The new soda company will put up a large plant and expect to ship 20,000 tons of soda a year.

MECHANICAL PROGRESS.

The Rapidity of Fire in Machine Guns.

The rapidity of fire with a single-barreled machine gun forms the subject of a letter of Mr. H. S. Maxim to *Engineering*. This letter is brought out by a new item, stating that a gun made by the Winchester "fires 1000 rounds a minute and beats the Maxim gun with its 750 rounds per minute." Mr. Maxim says his first gun officially tested at Enfield discharged 1000 cartridges in 11.2 minutes, or 666 per minute. This was with the Royal Woolwich cartridge, the most perfect then made. In another trial in Switzerland, with German Mauser cartridges, the rate of fire was 612 per minute. With the new Austrian cartridge with compressed powder, a speed of 770 shots per minute was attained. The highest rate of fire ever reached by an automatic gun, deriving all its energy from the recoil, was 775 shots per minute, made with cartridges made in the United States by the Union Metallic Cartridge Co.

About two years ago Mr. Maxim constructed a gun to utilize the force of the escaping gases at the muzzle to operate the mechanism. With the French Label cartridges a speed of 1100 to 1200 shots per minute was attained with this gun. But both French and German officers decided that the rate of fire was altogether too high, and they expressed the wish that he would reduce rather than increase it, and this was done. The first 1-pdr. Maxim gun fired at the rate of 400 shots per minute, and this speed was afterward reduced to 300 shots.

The effect of rapid firing upon the chamber and rifling of the gun is most marked, says Mr. Maxim. In Austrian trials, with a 600-shot per minute rate, with steel covered bullets, but with frequent stoppages to replace the ammunition boxes, the gun made as good a target after 20,000 rounds as at starting. But with a speed of 670 shots per minute and practically no stopping, the bore was considerably injured after 10,000 rounds.

Mr. Maxim thinks that with a single-barrel gun, with both gun and cartridge made expressly for the maximum speed, and utilizing both the recoil energy and the escaping force of the gas, a speed of 1500 to 1600 shots per minute might be attained. But at this rate the barrel would be very highly heated, even if inclosed in a water casing.

The greatest absolute speed of fire yet attained with machine guns operated by hand and with more than one barrel, is given as follows: With the 12-barrel Nordenfeldt, each barrel 100 rounds per minute, the Gatling 10-barrel, 100 rounds per barrel per minute; 5-barrel Nordenfeldt, with three trained operators, 400 to 500 rounds in all; 2-barreled Gardner, with four men, 333 rounds per minute. Mr. Maxim has fired a 3-pdr., with cartridges 21 inches long, at the rate of 40 rounds in 50 seconds, which is the best record he knows of for heavier guns with only one man attending.

Asphalt in India Rubber Compounds.

From the beginning of the rubber business manufacturers have appreciated the use of asphalt and tar in a variety of rubber compounds. Especially has this been true in goods cured in what is known as the dry heat. Boots and shoes, clothing and insulated wire compounds to-day all have a certain percentage of what is known as tar, but which is usually purified asphalt. The common belief that the goods are injured by the addition of this substance is wholly erroneous; a certain amount of asphalt compounded with rubber assists in calendaring, and during vulcanization imparts a certain toughness to the rubber which is not to be gained in any other way. The proportion used to-day is but small. For example, what would be known as a rich compound is 18 pounds coarse Para, 11 pounds litharge, 40 pounds whiting, 3 pounds asphalt, $\frac{1}{2}$ pound lamp-black, $1\frac{1}{2}$ ounces sulphur. Exactly what asphalt is very few people seem to know, and it is almost invariably in the popular mind confused with coal tar. Asphalt as a paving material has been known since the Babylonian empire, and to-day paving blocks are found that preserve their integrity and have hardly begun to oxidize, in spite of the atmospheric changes to which they have been exposed. It is only within late years that asphalt has been well known in the United States. It looks very much like pitch, and when ignited burns with a bright flame, giving off a dense black smoke. Alcohol, ether, oil of turpentine, naphtha, and many other reagents easily dissolve it. Its specific gravity is 2.23.

Until very recently all the real asphalt used in this country was imported. There is in the island of Trinidad a lake nearly two miles in circumference which is the source of the most of it, and it is said that near the shore the asphalt is very hard, but out in the center it is soft and viscid. When imported to the United States it comes mixed with sand and gravel and a variety of foreign materials, from which it is separated by heating over a slow fire for a week or more. During this heating process the impurities of a lighter nature rise to the top and are skimmed off, while the heavier substances settle to the bottom of the receptacle. There are very large deposits of asphalt in France and Switzerland, and within the last three years quite extensive deposits have been discovered in Utah and California, and small ones in Kentucky. For paving streets it is prepared by grinding first to a powder and mixed with crude petroleum and fine sand. It is then molded into blocks of suitable size, or sometimes it is poured between blocks of paving stones, when it becomes hard, and greatly resembles the natural rock.

Another use for asphalt is in the manufacture of black varnish, where it is dissolved in oil of turpentine and linseed oil and makes an exceedingly durable coating. For insulating electric wires this sort of coating has been found of great use, and it is said that one of the best rubbers for wires to-day manufactured is made of a fine compound containing 30 per cent of India rubber, the compound after semi-vulcanization being dipped in boiling asphalt, which toughens it exceedingly. As asphalt is not affected by acids or gases, and is an absolutely waterproof compound, and as heat and cold do not affect it, it is a valuable article to use in connection with India rubber, although if too large quantities of it are put in, it shortens the gum and may, during the process of vulcanization, cause it to blister. A great deal of the gum-roofing sold in the United States, which is thought to be India rubber or gu-ta percha, is made simply from a solution of asphalt spread upon prepared paper. —The India Rubber World.

ROLLING RAILS.—The process of rolling railroad rails of Bessemer steel, as practiced in Germany, says *Machinery*, is declared to be one of the most perfect mechanical operations in the world. The steel is cast in blocks which contain sufficient material for two or three rails, these blocks, while still red hot, being carried to the preparatory rolling mills by horses which have been trained to work in the midst of this fire and noise; here they are kept hot, in special furnaces, and are rolled into longer blocks having a square cross-section. After being thus prepared, they are taken to the rail rolling mills, which consist of two complete rolling mills, with all the appurtenances in one apartment, and the blocks which come from the preparatory mills are heated again and then passed between the rollers, of which there are three placed one above the other, so that the rails are rolled during the backward as well as the forward motion without requiring a change in the direction of rotation of the rollers. The rails have to pass back and forth between the rolls 13 or 14 times, and each time that they come from the rollers they are caught by the workmen on the short, bent ends of long levers which run on rollers on movable carriers. Each time the rail passes from between the rollers it is longer, and its cross section narrower than after the former rolling, until it finally stretches itself out like a gigantic frey snake. It is then taken to a circular saw, which cuts through the glowing metal with perfect ease, dividing the long bar into two or three rails. The cold ring is now put under presses, by means of which the slightest irregularities are removed, and then the bores are bored, the end surfaces evened, etc.

DOUBLE-BARREL BOILER.—The *Engineering News* says that a locomotive with a double-barrel boiler has been designed by the mechanical engineer of the Eastern railway, of France, and has been built at the company's works. The lower barrel is filled with tubes, and is connected with the upper barrel by three necks and by the throat plate of the firebox shell. The object is to have a boiler of large capacity without increasing the diameter beyond 4 ft. 4 ins., so that it may fit between the driving wheels. The engine is of the eight-wheel type, with outside cylinders at about the middle of the engine, and driving the rear pair of driving wheels, this arrangement being considered best for high speeds. The valve motion is also outside. The four driving wheels are 6 ft. 6 ins. diameter, and there is a four-wheel leading truck, with plate frames, and outside bearings. The engine is designed for hauling heavy passenger trains, and maintaining a continuous high rate of speed.

SCIENTIFIC PROGRESS.

Action of Frost on Cotton.

At the last meeting of the Manchester Section of the Society of Chemical Industry, a short communication by Mr. C. F. S. Rothwell, on "The Action of Frost on Cotton," was read. The literature published on this subject, said the author, gave the idea that cotton was "tendered" by frost. To quote Hummel's "Dyeing of Textile Fabrics," "the evidence on this point was conflicting, and it was quite conceivable that the crystallization might act injuriously in a mechanical way, and that the atmospheric ozone might also exercise some slight destructive influence." This uncertainty might be attributed to the fact that, until recently, no reliable machine for testing the strength of the cloth was available. To decide the question, two pieces of "madder bleached" cloth, one of good and the other of very poor quality, were placed in water for ten minutes, withdrawn, and without squeezing were exposed to a temperature of 4° C. (28° F.). The cloth was quite stiff in three minutes, and, when the ice had evaporated, its strength was tested in Goodbrand's machine against some of the original cloth, when the breaking weights were found to be identical. The trials were repeated, the cloth being frozen for 16 hours. In this case also the strengths were found to be identical. It was thus evident that cotton was not "tendered" by the freezing of water within it, at any rate not when in the ordinary width. If the fiber were compressed to a greater or less extent, as would happen at the bottom of a wagon load, the cloth might probably be weakened mechanically by the crystallization of the water, but he had no proof of this. The prevailing opinion that cloth was weakened by frost had, no doubt, arisen from the fact that when the fibers were frozen stiff they were easily snapped, but any stiffening body, such as gum, would have the same effect, and this had obviously nothing to do with the actual strength of the fiber. —*Textile Mercury*.

CIRCULAR MAGNETIZATION.—At a recent meeting of the Edinburgh Royal Society, Prof. C. G. Knott read a paper on the magnetization of iron by a current passing through it. The experiments were an attempt to get some insight into the nature of circular magnetization as it exists in an iron wire carrying a current. Direct experiment seemed hopeless. Accordingly tubes were used in which the circular magnetization was measured by the induction current produced in a coil wound longitudinally round the wall of the tube. The circular magnetization could be produced either by an axial current along a copper wire threading the tube, or by a sectional current from end to end along the tube itself. Several tubes of different bores were used in pairs, the induction, axial or sectional, in one, being balanced, by adjustment of resistances in the secondary circuits against the induction, axial or sectional, under the influence of the same current in the other. The average magnetic force acting round the tube was calculated in accordance with the usual assumptions, and this, taken along with the observed induction, gave an average permeability. The general result was that the sectional induction accompanying a given current is greater by about seven per cent than it would be if the usual theory as to the relation between it and the axial current were accurate. Direct experiment appreciably showed that a current flowing through iron does not increase permeability to inductive forces acting perpendicular to the current, so that the deviation mentioned must be due to the faultiness of the theory. With greater current densities, this deviation may be even more pronounced.

CARBONIC OXIDE.—When, in firing steam boilers, the coal or slack comes in contact with an insufficiency of previously heated atmospheric air, carbonic acid is generated, which, in the presence of an excess of carbonaceous fuel, becomes transformed into carbonic oxide. This latter gas, impinging upon the boiler plates, mingles with a fresh quantity of heated air, enters into combustion, and gives out considerable heat. Then, leaving as residue carbonic acid, it goes up the smokestack after giving up its caloric, more or less completely according to the arrangement of fire-grate and flue tubes, while raising the temperature of the air for supporting combustion. In all these reactions, the nitrogen of the incoming air remains perfectly inactive, while drawing along with it through the furnace a considerable quantity of heat which is entirely wasted. To reduce this loss to a minimum,

Herr Siemens has designed a boiler furnace, which he feeds with the products of combustion drawn from the smokestack, thus utilizing the carbonic acid already generated. It is found that by this arrangement the coal gives a better yield of caloric power, by suppressing the formation of carbonic acid, and also by diminishing the quantity of atmospheric air, and therefore of nitrogen, passing through the furnace. —Chicago Journal of Commerce.

COLOR PHOTOMETRY.—The following suggestion for determining the constitution of light has been sent to the *Optician*. It is clumsy as compared with methods involving the application of the spectroscopic, but we publish it for what the idea may be worth. A disk of thin metal has two annular rows of sector-shaped apertures. The apertures of the innermost of these two concentric rings are each closed by a thin piece of ground glass. Each of the apertures of the outer row contains a piece of differently colored glass. The outer ring is, in fact, a transparent "Newton's disk," and when the apparatus is rapidly rotated, and the light to be tested is placed at some distance behind it, this light is transmitted by the outer circle of apertures with more or less modification according to the relations subsisting between the areas of the differently colored sectors of glass. Every transparent sector in the revolving disk is provided with an adjustable opaque screen or shutter, and the shutters can be adjusted either by stopping the disk or, while it is in motion, by mechanical arrangements that we have not space to describe. The shutters of the outer ring are adjusted by trial until the light transmitted by the corresponding glass sectors, when the disk is rotating, appears of nearly the same color with that transmitted by the inner ring. Next, the colorless inner sectors are, themselves, obscured until the luminosity of the two rings becomes equal. The adjustment of the outer row of shutters is completed, and the composition of the light is deduced from the relations between the exposed areas of the colored glasses. Substituting reflection for transmission, it is evident that the same process of color photometry could be carried out by the aid of an ordinary "color top." It could also be arranged that light from two or more sources should be directly compared.

THE CALORIFIC CAPACITY OF METALS. Mons. Le Verrier has investigated the specific heat of various metals at high temperatures. He has experimented on iron, copper, aluminium, zinc and lead. He showed, in *La Nature*, that if the results be represented by means of a curve line, having the temperatures for abscissas, the numbers obtained are indicated by two sections of straight lines joined to each other, in a certain thermic part, by a curve line. Mons. Le Verrier finds that these suture curves do not remain identical for the same metal accordingly as the experiments have been made at a rising or a lowering temperature; whence results that the body preserves, from a caloric point of view, traces of the condition through which it has previously passed. Mons. Berthelot, further, observes that although this result may be novel with respect to metals, it only confirms those which are supplied by various bodies in organic chemistry, chloral hydrate for instance, of which the caloric of fusion is 4000 calories, but which leaves only 2000 calories in solidifying. Waxes present similar phenomena, which may be attributed to a molecular change in the state of the body.

ECLIPSES.—Every year there must be two eclipses of the sun, and there may be five. These are partial eclipses, however, except in the comparatively rare case in which the moon passes nearly centrally over the sun's disk and produces a total obscuration of his light. Since the invention of the spectroscopic, in 1860, there have been barely a score of total eclipses, and a number of these could not be observed because the belt of totality fell at the earth's polar regions or upon the oceans. The belt of totality is a narrow strip—never more than 170 miles wide—where the point of the moon's shadow falls upon the earth. Total eclipses rarely recur, therefore, at the same point of the earth. At London, for example, there has been no total eclipse since the year 1140 except that of 1715, and there will be none during the next century. —Prof. E. S. Holden in the April Century.

A COLLECTOR'S OUTFIT.—At the last meeting of the San Francisco Microscopical Society, George Otis Mitchell exhibited a novel and inexpensive collecting apparatus he had lately constructed, with slight modifications from those heretofore used. It consists of two wired tin rings, the outer slipping over the inner and securing the net

of holding cloth. The net narrows downward, the lower end being the size of a wide-mouthed, two-ounce bottle, around which it is fastened with a piece of cord. A socket fastened to the ring is of a size admitting the ferule of a walking-cane, which enables the collector to sweep through the water at a considerable distance from the shore. Mr. Mitchell thought a collecting apparatus of this kind would often secure specimens of animal and vegetable life, when the most assiduous work with the ordinary method would show nothing of interest, or only such as are very numerous. With his apparatus he was enabled to secure quantities of that most beautiful and elusive fresh water alga, *Volvox globator*, at any time he chose to take a dip in Mountain lake.

ELECTRICITY.

Electric Traction on the Southern Pacific.

The electric motor is not only crowding out other sources of power in street railway traction, says the *Electrical Review*, but is opening competition with the steam locomotive in a field which has heretofore been the exclusive property of the latter. The high speeds attainable will eventually make it a winner for long distance work. A few months ago we described an electric locomotive put into operation near Boston for shifting freight cars. We have just learned that five of the great railway companies of the country have been inspired with sufficient confidence in electric traction to come into consultation, with a view to its adoption for handling the suburban traffic of the large cities, and one of them, the Southern Pacific, has placed an order with the Walworth Manufacturing Company for trolley poles to install such a plant on its lines. This is the entering wedge in what will ultimately result in a general application of the electric motor to railroad work, and, after a short period of service for suburban traffic, engineers will be called upon to design a system for interurban traffic. The adoption of the electric motor would be a boon to a community like Chicago, where the smoke from the numerous locomotives of a score of railroads centering at that point hangs like a pall over the blighted city. To the railroad companies this step means reduction of operating expenses, a style of appeal which brings certain conviction of its merit. In lieu of a hundred different fires and boilers, with the great attendant waste necessarily incident to development of small power units, a single generating plant can be used; the saving in fuel under such circumstances will be considerable. It will also enable more work to be handled without increasing the pay roll of employees. The fireman now necessary in each locomotive can be transferred to other work.

Oil as an Insulator.

The experiments on high-tension discharges of high frequencies described in the *Electrical Engineer*, by Prof. Elihu Thomson, besides illustrating the simple methods required to obtain brilliant discharge effects seemed to point to some remarkable properties of oil as an insulator, and Professor Thomson has referred to the great future which the application of oil insulation opened up in the field of high-tension transmission. Continued experiment, however, has developed facts which have led Prof. Thomson to modify his views somewhat on the subject of oil insulation, and in reply to a letter on this subject he writes the *Engineer* as follows:

"It is more than probable that I shall have to make a revision of my views as stated in relation to oil as an insulator. In conducting my experiments, I have been testing the striking distance in oil with varying periodicities and with varying forms of discharge electrodes, and I find that the results would seem to indicate that with an oil such as we have been using for the insulation of the high-period discharges at enormously high voltages, there is a much less resistance to discharges of the ordinary alternating character at low rates, such as 125 periods, or 250 alternations.

"I find that considerable distances in oil are punctured. In fact, the distances in some cases are quite comparable with the distance which the discharge leaps in the air. I find, also, that with high-period currents, such as I get from my high-period alternating machine giving from 3000 to 5000 or more alternations per second, different effects are obtained; though the experiments are not yet complete.

"One of the most curious things noticed in the conduct of the experiments has been the time which it takes to break down the

oil. For example, for a short contact of a half second or so, oil even in fairly thin layers seems to insulate, but if the contact be continued over some seconds, or even to half a minute or more, the discharge may break through the insulating layer. The time taken seems to increase with the distance of the electrodes apart under the oil. I have given these preliminary results hoping to investigate the subject pretty thoroughly and to really understand something about oil as an insulator before we get through."

Current Required for Incandescent Lamps.

The *Electrical World* receives many inquiries from correspondents asking what currents incandescent lamps of certain voltages will take. In some respects this question is like the one asking what the size of a stone is. The best reply that can be given, and the only really satisfactory way to get a fair average, is to place a number of these lamps, say 10 or 100, on a circuit and measure the current with an amperemeter, first being sure, however, that the electromotive force is the right amount. A good voltmeter and ammeter are therefore required. To ask the lamp sellers appears to be of little use, and would probably be unsatisfactory, as they will either not reply at all or give an evasive answer; or if they give any figure, it is apt to be lower than the true amount, which overestimating of efficiency seems to be considered a manufacturer's license. A very good custom, which seems to be growing among lamp manufacturers, is the rating of lamps by their efficiency in watts per candle, and whenever such figures can be obtained, the current required by a lamp is very easily calculated. The usual efficiency is about four watts per candle, which, multiplied by the alleged candle power and divided by the stated voltage, will give the current in amperes. As lamps may be ordered for a given efficiency, this figure may be relied upon to a certain extent, as it is then accompanied by a sort of guarantee on the part of the makers. The Edison Company makes lamps of 3.1, 3.6 and 4 watts per candle. The Thomson-Houston lamps are for 3.32, 3.5 and 4 watts for 52, 75 and 100-110 volts respectively. The Economic Company's lamps are for 3.8 watts, and the Germania for 4 watts. The lower this figure, the more economical the lamp will be, but in general the shorter the life. Low volt lamps, as a rule, use less watts per candle than those of high voltage, for the same life. The wireman will be safe if he assumes the larger figure, namely, four, as his wires will then at least not be too small. With these figures, provided the lamps really have the alleged candle power, any one can calculate the current required.

COST OF THE ELECTRIC LIGHT IN MILLS. Some remarkable figures have lately been published with regard to a 150-light installation in some large steam mills in Barrow-in-Furness. The installation was laid down in 1885, and includes a Mather & Platt dynamo, driven off countershafting from a horizontal Marshall engine, supplied with steam at 65 pounds pressure from the mill boilers. Taking the average for the six years, we have the following figures: Annual cost, £92; cost per lamp hour, .059d. The price of gas in Barrow being three shillings per thousand, the annual cost of an equal number of No. 5 burners consuming 5½ cubic feet per hour, would be £314. If we take the 16 c. p. Edison-Swan lamp as consuming on the average 80 watts, the lamp hour at .059d. is equivalent to the Board of Trade unit at ¾d., the price charged per unit in London being 7d. to 8d. The average life of each lamp at this phenomenal mill comes out at 3484 hours, and there are two or three of the originally installed lamps still burning which have run for 20,000 hours.

THE ELECTRIC LIGHT IN THEATERS.—Among the many devices now employed to utilize the electric light for producing beautiful scenic effects, says the *Electrical World*, is one which has just appeared at Proctor's Twenty-third Street Theater to represent a sunrise. A curved scene extends around the stage, part of which is painted on gauze so that light may shine through, and behind it is an elaborate system of incandescent lights. The controlling apparatus is so graduated that 50 different degrees of light and shade can be produced, thus causing the sunrise to grow imperceptibly. Another use of the electric current is to represent the explosion of a bomb. A paper shell contains just enough powder to explode and make a flash. This is fired by electricity, while at the same moment another circuit, controlled by the same key, sets off a gun behind the scenes, which furnishes the necessary noise.

ENGINEERING NOTES.

Transmission of Power.

One of the most timely papers read at the Buffalo Convention of the National Electric Light Association was by Carl Hering on transmission of power, special attention being paid to methods of utilizing and conveying to Buffalo a portion of the power of Niagara Falls. First, the author considered hydraulic, pneumatic and wire-rope transmission, giving as the efficiency of each, respectively, 18, 39 and 11 per cent for a distance of 13 miles. A rather novel way of dealing with the transmitting of power is that of considering the cost of transporting coal itself from the mines to manufacturing cities. In Philadelphia the price of a ton of coal is doubled by the cost of its transportation from the mines, and therefore an efficiency of only 50 per cent is obtained in the transmission.

The most essential portion of the paper, and the one of most value, since the author is thoroughly conversant with the subject, is that discussing the systems of electrical transmission. To be successful at all for long distances, requires the use of very high potentials, as otherwise the cost of the line would make it impracticable. Continuous currents, to be available, must be generated directly by the dynamo at that high potential, as there is no means at present known of converting a low-tension continuous current into one of high tension without the use of moving machinery. Experience and experiments have shown that it is not practicable to exceed 5000 or 6000 volts at the very most on continuous current dynamos. It is thought, therefore, that the field is left tolerably clear for alternating currents for the following reasons: 1. Because alternating current dynamos require no commutator. 2. Because such currents can be converted readily from a low tension to a high tension, and the reverse, with only a small loss in each transformation. An alternating current dynamo for generating low potential currents is the simplest type, and a transformer requiring no moving machinery is a very simple thing to take care of, if, indeed, it requires any attention at all.

The only important objection to the use of alternating currents is that they are not so suitable for running motors as direct currents are. The so-called synchronous motors are alternating-current dynamos used as motors. As their name implies, they must run at precisely the same speed as the dynamo, and many of them come to a dead stop if loaded so as to reduce that speed. The principal difficulty is found in the fact that they cannot be started readily, and all the load must be taken off before they can be started at all. The opinion is expressed that before very long this problem will be solved by several methods, so as to leave but few objections to the employment of alternating currents.

There are two ways of transmitting power to great distances by alternating currents. One, used at the Ferranti Station in London, is to generate high-tension currents at the dynamo and at the distant ends transform these currents into low-tension ones. The second is the method used successfully at Frankfurt, consists in generating low-tension currents, transforming them at the dynamo station into high-tension currents, which are sent over the line and then transformed back to low tension. This method Mr. Hering thinks to possess more advantages than the first.—Iron Age.

POPULARIZING AIR AS A CARRIER.—Owing to the increase in the number of air brakes used, most railway shops find it necessary to have their plants supplied with air pumps, with pipes leading to all important parts of the shops to be used in testing. Another way in which this air pressure can be used to great advantage is in the sending of small, light articles from point to point. The transfer of mail and messages from one office to another, particularly when they are located in the different stories of a building, is often a great cause of annoyance. The average messenger boy is not a very reliable person and is often not at hand when his services are demanded the most, which fact sometimes causes a delay in the delivery of important messages. It is probably questionable whether it would pay to establish an expensive system for this purpose, but there are a great many places about large plants where a short and straight line could be established. A very successful and convenient arrangement of this kind has been put in operation in at least one of our large railway shops. The tubes are made of heavy, galvanized iron, made by an ordinary tin-smith, and consequently the expense is not great. The carrier is made of the same material, with a piece of leather fastened on

one end forming a packing, and in the other end is driven a wooden plug to act as a guide and receive the shocks caused by the stopping of the carrier at the end of its journey. A very small amount of air is consumed in the transfer of a message, and instead of waiting for a messenger boy the messages can be delivered in a few seconds from either end of the line at any time. Two or three such tubes as these in a large plant might easily save the expense and annoyance of a messenger boy and prove a great convenience.—Railway Review.

USEFUL INFORMATION.

THE BEST LEATHER.—Experiments were recently made to determine which portion of a hide of leather gave the best results when made into belting, says the *Manufacturers Gazette*. Four strips, each 18 inches long and two inches wide, were cut and carefully tested in a machine. One of the pieces from the center of the hide broke at a strain of 2490 pounds, equal to 14.940 pounds per foot of width, while the strip from the upper part of the shoulder parted at 1130 pounds. The experimenter stated that double belts made with pieces from different portions of the hide were defective, the shoulder part being much more liable to stretch, and is not able to stand as much strain as the center. He claimed that a double belt would be much better if made from the same parts of the hide throughout, and that if made entirely of centers it would stand a strain of 30,000 pounds per foot of width, whereas a belt made from shoulders would hardly stand 15,000 pounds per foot of width.

ELECTRICITY AND WINDMILLS.—An electric-lighting plant, driven by a windmill, is in operation in a London flour mill, according to the *Engineer*. The windmill is of the well-known Halliday type, made by the United States Wind Engine and Pump Co. of Batavia, Ill. It is 30 feet in diameter. A reasonably uniform speed is obtained by the construction of the wheel. Whenever the force of the wind is such as to give the wheel the necessary speed, a connection is automatically made, and the wheel drives a dynamo, which furnishes current to a storage battery of 28 cells. An automatic switch reduces the current when the speed is too high, and prevents too much current being forced into the battery at any one time. The current obtained from the storage battery is sufficient to operate two 1500 c. p. arc and several incandescent lamps.

THE ELECTRIC CRANE.—Among the applications of electricity to machinery, says the *American Manufacturer*, that of its union with traveling cranes is of no mean importance. Instead of having a certain predetermined speed of travel and hoist, that cannot be departed from, the electric crane possesses the advantage of being under perfect control of the operator, can be gradually accelerated or retarded, smoothly and noiselessly, or may be kept at the same speed indefinitely. Three 15-ton cranes are in operation in a Milwaukee shop, having a hoisting speed of 25 feet per minute, a longitudinal traverse speed of 350 feet and a transverse traverse speed of 125 feet per minute.

QUICKSAND.—The reason a person sinks in quicksand is because the latter is composed chiefly of small particles of mica mixed largely with water. The mica is so smooth that the fragments slip upon each other with the greatest facility, so that any heavy body which displaces them will sink, and continue to sink until a solid bottom is reached. When particles of sand are ragged and angular, any weight pressing on them will crowd them together until they are compacted into a solid mass. A sand composed of mica or soapstone, when mixed with sufficient water, seems incapable of such consolidation.

A NEW miner's safety lamp, constructed to burn petroleum oil, has just been patented by Messrs. Richard Johnson, Clapham and Morris, of Manchester, England. The special advantage of this lamp is that while it combines every possible protection against the risk of igniting any explosive atmosphere in the mine, the light given is two or three times more powerful than that obtained with the ordinary safety lamps.

EVERYONE may not know that the Bank of England notes are made from new white linen cuttings, never from anything that has been worn. So carefully is the paper prepared, that even the number of dips into the pulp made by each workman is registered on a dial by machinery.

TABLE OF CONTENTS.

MISCELLANEOUS.—Against Boycotts; How Society is Indebted to Invention; How They Measure Electricity; Differential Staining with Eosin; The Vallecitos Oil Fields, 352; Gold and Silver in the United States in 1891; Elts of Practical Experience; Prospecting in Fresno; Fibre-Graphite; A Big Mining Suit; Crystal Salt; The New Caledonia Nickel Mines; Electrical Locomotives; The World's Submarine Cables; They Paid the Dividend, 353.
MECHANICAL PROGRESS.—The Rapidity of Fire in Machine Guns; Asphalt in India Rubber Compounds; Rolling Rails; Double-Barrel Boiler, 356.
SCIENTIFIC PROGRESS.—Action of Frost on Cotton; Circular Magnetization; Carbonic Oxide; Color Photography; The Caloric Capacity of Metals; Eclipses; A Collector's Outfit, 356.
ELECTRICITY.—Electric Traction on the Southern Pacific; Oil as an Insulator; Current Required for Incandescent Lamps; Cost of the Electric Light in Mills; The Electric Light in Theaters, 357.
ENGINEERING NOTES.—Transmission of Power; Popularizing Air as a Carrier, 357.
USEFUL INFORMATION.—The Best Leather; Electricity and Windmills; The Electric Crane; Quick-sand; Miscellaneous, 357.
ILLUSTRATIONS.—Sargent's Concentrated Piston Inlet Cold Air-Cylinder; Automatic and Adjustable Regulator and Unloading Device; Horizontal and Curved Strata of Pipe-Clay at Benca; 359; Ingersoll-Seagant Piston Inlet Cold-Air Compressor, 361.
EDITORIALS.—The Ingersoll-Sargent Cold-Air Compressor, 351. American Society of Mechanical Engineers; A Stupendous Column of Water; The Mining Bill in Congress; Another Silver Convention, 355. Heretical Geology, 359.

Another Silver Convention.

The National Silver Committee appointed by the First National Silver Convention, held at St. Louis November, 1889, believing that the exigency has arisen which calls for earnest consideration and united action on the part of the friends of bimetalism throughout the United States, has issued a call for a convention to be known as the Second National Silver Convention, to be held at Washington, D. C., May 26th and 27th, 1892. One of the objects is to organize a National Bimetallic Association or League for the better promotion of the cause of free bimetallic coinage in the United States.

The call is extended to all who earnestly favor the immediate restoration of free bimetallic coinage in the United States, and each congressional district is requested to send two delegates, and each State and Territory to send two additional delegates at large. Farmers' Alliance organizations, State Granges, Patrons of Husbandry, Knights of Labor, and all other industrial organizations favorable to the free coinage of silver, are also invited to send one delegate for each local organization. A cordial invitation is also extended to all citizens who, by pen or otherwise, have been advocates of bimetalism.

Members of Congress and of the Legislatures of the several States who favor the restoration of the bimetallic standard and the coinage of silver on the same terms as gold are especially invited to attend and participate in the proceedings of the convention.

The Mining Bill in Congress.

Those in charge of the mining debris bill, as it is called, at Washington, are more than hopeful of its passage this session, and a day will be set for its consideration, in all probability.

The main difficulty in the way now is the opposition shown by Congressman Geary of this State, a man, too, pledged to support the measure, and elected from a mining region. He introduced a bill of his own, local in its nature, and always did object to the Caminetti bill, which is broader and more general in its provisions. The miners' delegates have had hard work with Mr. Geary, and now he comes out openly in opposition, because Caminetti opposed some harbor measure of his.

The State Miners' Association and the County Miners' Associations have adopted resolutions adverse to Mr. Geary's course, and calling upon him to support this California measure, to which he stood pledged. He declares he does not desire reelection, so feels independent in the matter. It is much to be regretted that this man puts his personal opinion in opposition to the desires of his constituents; in a measure, too, of such great importance. His attitude is inimical to the best interests of the State he is supposed to represent. Opposition was, of course, expected, but not from a man from the mining districts. The miners here are highly indignant, but if they will send small men to Congress, they must expect small actions.

Aside from this action of Geary's the news from Washington is encouraging. Mr. Luttrell is still there in the interest of the miners. Mr. Hobson will be back here this week. Judge Searles has left Washington, but has not returned home.

A Stupendous Column of Water.

Altogether the most extraordinary water power installation—so far as head is concerned—ever known has recently been made by the Pelton Water Wheel Co. in one of the famous Comstock mines at Virginia City, Nev. The wheel is 36 inches diameter made of a solid steel disc with the buckets riveted on to the periphery in a way to afford absolute security, weighing complete 180 pounds.

It is running under a vertical head of 2100 feet, equal to 911 pounds pressure. Four hundred and sixty feet of this head is obtained from the pipe line of the Gold Hill Water Co., and the remaining 1640 feet from the California & Con. Virginia shaft, down which the pipe line is run to the Suto tunnel level where the wheel is located, and through which the water discharges after passing over the wheel. The wheel runs at 1150 revolutions, with a peripheral speed of 10,804 feet per minute, or about 120 miles per hour.

The construction of the wheel amply provides for the centrifugal strain the velocity of the water gives it, running without load, when it would attain the enormous speed of 21,608 feet per minute, equal to about 240 miles per hour. A nozzle tip one-half inch diameter gives under above conditions 100 horse power. Every miner's inch of water—equal to a flow of 1.6 cubic feet per minute—gives five horse power, while one horse power is given for every two pounds of metal in the wheel. It is only by comparison that an idea can be obtained of the height of a column of water due to such pressure. It is more than four times as high as the Washington monument, and considerably more than twice the height of the Eiffel tower. It is safe to say that no water wheel has ever before been operated under any such head nor any such demonstration afforded of the velocity and power of water under such an extreme pressure.

The installation made by the Pelton Company some two years ago in the Chollar shaft, on the Comstock lode, is in some respects no less extraordinary. This consisted of six 40-inch Pelton wheels, which

run under a vertical head of 1680 feet, driving that number of electrical generators, the power from which is conveyed up the shaft to the Nevada mill, some 2000 feet distant. These wheels only weigh 220 pounds each, and with nozzle tips five-eighths of an inch diameter develop 125 horse power each.

The water is first run over a Pelton wheel on the surface under 460 feet head, and is then carried down the shaft by a pipe to the Suto tunnel level, where the underground station is located, the power from the electrical generators being conveyed to the counter shaft of the mill with which the surface wheel is connected, the two distinct forces working together in perfect harmony.

A most interesting feature of the double use of water is here illustrated, some 400 horse power being produced in this way from what may be termed waste water. This station has now been running more than two years without interruption, and practically without expense in the way of repairs, affording a most striking example of the advantages of water power both by direct application and electric transmission, as well as the reliability of such a plant under such extraordinary conditions.

American Society of Mechanical Engineers.

The members of the American Society of Mechanical Engineers who make the California trip will be in this city on Monday, and will be suitably entertained by their professional brethren.

On Friday morning, May 13th, the party will be met as they cross the Sierra Nevada mountains, on entering California, by a committee of ladies and gentlemen going from San Francisco and Sacramento, under the guidance of Mr. H. J. Small of Sacramento. Mr. Small will have carriages in waiting to convey the party to the railroad shops, Capitol, Crocker Art Gallery, and other points of interest. Leaving Sacramento, they will be accompanied on their way to Monterey by an escort of ladies and gentlemen in a special car, who will render all the assistance possible in making their journey pleasant. On their arrival and during their stay at Monterey, the party will be in charge of Mr. E. J. Molera, vice-President of the Academy of Sciences, who will act as chairman of a special committee to entertain them by drives and other means.

Monday, May 16th, at 10:30 A. M., the party will arrive in San Francisco, where they will be met at the Palace hotel by the Citizens' Committee, as per program, the time to be set hereafter.

During their stay here, there will be a trip around the bay in Spreckel's new tug, the "Fearless," through the Golden Gate, and up Mare Island Straits to the Navy Yard, there to disembark and visit the shops and dock; then to return to the tug, where a lunch will be served on the way back to the city. The greater part of the day and an early start will be required for trip.

There will also be a trip to Pillarcitos dam, under the auspices of Mr. Chas. Webb Howard and Mr. Herman Schussler of the Spring Valley Water Co. A train will be furnished at Fourth and Townsend for San Mateo. The party will be met by carriages and a visit made to the dam, and a collation served at the grounds. The whole day will be required.

There will also be a trip to the Cliff House and Suto Heights, the residence of Mr. Adolph Suto. There will be a trip also to the Union Iron Works and Pacific Rolling Mills, where the ship yards, the

Government vessels, hydraulic docks, etc., will be inspected. The tug will convey the party from the foot of Market St. to the works and return. The Risdon and Fulton Iron Works, the Pelton Water Wheel Co. and other works will be visited under the escort of a proper committee. Visits will be made to all the cable-road power houses and the electric roads of the city. On this trip, Mr. A. S. Hallidie, father of the cable railway system, has kindly consented to take charge of the party. Guides will be appointed and proper time selected for these trips to suit the convenience of those desiring to visit these places.

An exhibition of machinery and mechanical appliances used on the Pacific Coast will be given by means of lantern slides at the Academy of Science Hall, on such an evening as may be selected by the guests; and other trips and entertainments for both the engineers and their ladies will be arranged for as soon as it is known what amount of time the visiting party can accord us. This program is subject to revision to suit the convenience of the guests.

The local committee has provided a very pretty souvenir badge for the ladies of the visiting party. It is in the shape of a spoon fashioned like a miner's shovel and made of silver. It is arranged with a clasp to be worn as a pin. On the face of the shovel blade are the words "San Francisco," and on the reverse, "A. S. M. E., May 16, 1892." The handle of the shovel is ornamented by a small silvery grizzly bear.

It is to be hoped that the mechanical engineers of this city, whether members of the society or not, will take a personal interest in the entertainment of these gentlemen and ladies, and give the local committee all the aid they can. The sessions of the society will be held at the Academy of Sciences Hall, Market street, near Fourth, at hours to be announced in the daily press.

The party, which left New York on May 4th, was composed of the following, although others probably joined at other cities on the way:

Wm. H. Wiley (Treas. of the Society), New York; Prof. F. R. Hutton, Secretary, A. S. M. E.; John T. Byrd, Gen. Mgr. Stearns Mfg. Co., 233 West Seventh St., Erie, Pa.; F. H. Lafarge, Chief Insp. Conn. Mut. S. B. Waterbury, Conn.; Thos. J. Borden, Pres. Richard Borden Mfg. Co., Fall River, Mass.; Thos. Hibbard, M. E. and Treas., Geo. Lawley & Son, South Boston, Mass.; Wm. F. Monaghan, 169 E. 60th St., New York; F. M. Power; W. B. Cogswell (Manager 1890-92), Gen. Mgr. Solvay Process Co., Syracuse, N. Y.; Washington Jones (Vice-Pres. of the Society in 1891-92), Philadelphia, Pa.; Wm. C. Williamson, Williamson Bros. E. & B. Works, Philadelphia, Pa.; J. D. Williamson; R. W. Hunt (Pres. of the Society in 1890-91), Cons. Eng'g, Chicago, Ill.; H. O. Francis, Pres. Steam Eng'g Co., Philadelphia, Pa.; Addison Hutton; Alfred Betts, Pres. Betts Machine Co., Wilmington, Del.; Edw. Andrews; D. G. Moore, Vice-Pres. S. L. Moore & Sons Co., Elizabeth, N. J.; Prof. D. S. Jacobus, Asst. Prof. Experimental Ship Work, Stevens Inst., Hoboken, N. J.; Fred. H. Daniels, Washburn & Moen Mfg. Co., Worcester, Mass.; C. W. Hunt, No. 46 Broadway, New York; Joel Sharp (Vice-Pres. of the Society in 1889-91), Pres. Buckeye Engines Co., Salem, O.; Chas. M. Trump, Mech. Eng. The Solvay Process Co., Syracuse, N. Y.; Vincent G. Hazzard, draughtsman with The Pusey & Jones Co., Wilmington, Del.; Jas. McBride, Supt. N. Y. Dyewood Extract and Chemical Co., Brooklyn, N. Y.; Albert Stearns, Supt. Church, & Co. Chemical Works, Brooklyn, N. Y.; D. Ashworth, Mech. & Cons. Eng., Pittsburgh, Pa.; S. T. Wellman, Pres. Wellman S. & L. Co., Cleveland, Ohio; W. S. Wellman; Edward H. Parks, Mech. Eng. Brown & Sharp Mfg. Co., Providence, R. I.; Fred'k A. Schussler, Supt. Brush Elect. Co., Cleveland, Ohio; F. Martins, India Rubber Comh Co., L. I., New York; W. E. Schoenhart; Harry S. Haskins; M. P. Higgins, Supt. Washburn Mech. Shop, West St., Worcester, Mass.; Geo. I. Alden, Prof. Mechanical Eng'g Polyt. Inst., Worcester, Mass.; John Knickerbocker, Pres. Eddy Valve Co., Watford, Troy, N. Y.; Walter G. Cotton; Geo. H. Smith, Beam & Smith, Providence, R. I.

Messrs. Wiley, Wm. C. and J. D. Williamson, Hunt, Betts, Andrews, Moore, Daniels, C. W. Hunt, Sharp, Trump, Hazzard, McBride, Ashworth, Wellman, Parks, Haskins, Higgins and Smith are accompanied by their wives. In addition to these, there are in the party the following ladies: Sarah K. Wiley, Helen Wiley, Mahel Cogswell, Mrs. Mary W. Bringham, Mrs. H. B. Winehoener, Mrs. A. K. Mansfield, Mrs. H. G. Hammitt, G. L. Hammitt, F. S. Hammitt, and Gertrude L. Stearns.

THE mining outlook around Colfax is good. The Rising Sun company has already started to work and about the first of next month the Big Oak mine will be started.

Heretical Geology.

BENICIA, CAL., May 7, 1892.

TO THE EDITOR:—Geologists assume that in the formation of the earth's crust, as they term it, all strata were originally laid down in a horizontal position. An accidental circumstance caused me to make this subject a special study. From my own observation I became convinced that the assumption which I have specified was a fallacy. In order to show the importance of this assumed prin-

the strata shows that such a thing could not possibly have occurred in this instance. The entire body of gravel in which the excavation has been made, unquestionably remains precisely as it was originally deposited by the action of the water.

It may be contended that the example which is here illustrated is on a scale too small to make a just comparison with such instances as have governed geologists in their conclusions. The governing principle is the same, whether a stratum found in the

ment as this, it is sufficient to cite the fact that the Ptolemaic system of astronomy was orthodox science for a thousand years, and even after Galileo, by the use of the newly invented telescope and by mathematical demonstration, had shown the absolute falsity of the principle or theory on which

Ingersoll-Sargeant Cold-Air Compressor.

(Continued from page 351.)

The air inlet pipe which extends through the cylinder-head serves as a bearing and support for the piston, thus insuring the minimum wear in the air cylinder, and a

AUTOMATIC AND ADJUSTABLE REGULATOR AND UNLOADING DEVICE.

SARGEANT'S CONCENTRATED PISTON INLET COLD AIR CYLINDER.

perfect uniformity of such wear as must take place in every engine. Another cut shows the unloading device and regulator, as applied to the Ingersoll-Sargeant air compressor. The purpose of this unloading device is to maintain a uniform air pressure in the receiver and a uniform speed of engine, notwithstanding the consumption of the air, and to do this without waste of power or attention on the part of the engineer. A weighted valve of safety valve pattern is attached to the air cylinder, and is connected with the air receiver, and with a discharge valve on each end of the air cylinder, also

with a balanced throttle valve in the steam pipe. When the pressure of the air gets above the desired point in the receiver, the valve is lifted and the air is exhausted from behind the discharge valves, thus letting the compressed air, at full receiver pressure, into the cylinder at both ends, and balancing the engine. At the same instant, the compressed air is exhausted from the little piston connected with the balanced steam valve and the steam is automatically throttled, so that only enough steam is admitted to keep the engine turning around, or to overcome the friction, no work being done. When the compressor is unloaded, it is evident that the function of the air piston is merely to force the compressed air through the discharge valves and passages from one end to the other until more compressed air is required, this being indicated by a fall in the receiver pressure. The weighted valve now closes and the small connecting pipes are instantly filled with compressed air; the steam valve automatically opens and the compression goes on in the regular way. Another function of this device is to prevent the compressor from stopping or getting on the centre. Direct-acting compressors are liable to centre when doing work at slow speed. The Parke & Lacy Co. of this city are sole agents on this coast.

ciple in the science of geology as it is now taught, I will quote verbatim from Le Conte's Elements of Geology. In chapter second of said work, which treats of stratification, beginning on page 17, he says: "The most important points connected with stratified rocks we will now, for the sake of greater clearness, bring out in the form of distinct propositions. On these propositions is based nearly the whole of geological reasoning. First, stratified rocks are more or less consolidated sediments. . . . Second, stratified rocks have been gradually deposited. . . . Third, stratified rocks were originally nearly horizontal."

There is shown herewith a photographic engraving which gives irrefragable proof of the fallacy of the third and most important of the propositions just quoted. It is taken from the perpendicular face of an excavation being made in the town of Benicia. It is doubtless a deposit of the Drift period, contemporaneous with the plain gravel of this State. No portion of it has become so hard but that it may be easily removed by the use of the pick. It is composed chiefly of fine gravel and coarse sand, intersected by a stratum of pipe clay.

The engraving shows a stratum of pipe clay with one portion horizontal, while another portion of the same has a very considerable degree of curvature immediately over another stratum lying horizontal. If it appeared singly, a geologist would say that it had been bent into a curved form after being deposited; but the relative position of

manner illustrated by two feet in thickness, or two hundred, or two thousand, even; the difference of the quantitative result arising merely from the difference in the magnitude of the false system. I will mention a less con-

HORIZONTAL AND CURVED SARATA OF PIPE CLAY AT BENICIA.

of the producing forces. The theory that all strata was originally deposited horizontally, and that whenever it now appears in a different relation it is the result of subsequent disruption or distortion and displacement, forms the basis of the science of geology as now taught. It is a false basis.

I apprehend that it will be urged against my position that it is hardly possible that a large number of wise men would devote their lives to the study and teaching of such a science as geology without discerning the falsity of the principle or theory on which it is founded. In answer to such an argu-

spicious instance of the present time, wherein it will be shown what great mistakes learned men may make in their conclusions. Charles Darwin, one of the most famous scientists of the nineteenth century, prepared and published a treatise on the earthworm, wherein he taught that it was a prime factor in the production of all the arable surface of the earth; when, as a matter of fact, the earthworm is one of the scavengers provided by infinite wisdom, which, like the common housefly, accompanies, but never precedes, civilization.

JUSTIN CHENOWETH.

A New and Valuable American book for Prospectors and Miners.
JUST READY.

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings. 12mo, 176 pages. Price \$1.50, by mail, free of postage, to any address in the world.

Contents.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analyses of Ores, Wet Method, Dry Assay of Ores. V. Special Mineralogy, Gold, VI. Platinum, etc., Silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron, X. Mercury, Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of the useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. 8vo. 387 pages. Price \$4.50, by mail, free of postage to any address in the world.

Descriptive circulars giving the full tables of contents of the above books sent free to any one who will send his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

A New and First-Class Book on Perfumery.

JUST READY.

A PRACTICAL TREATISE ON THE

Manufacture of Perfumery.

Comprising directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentrifices, cosmetics, etc., etc.; with a full account of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Dr. C. A. DAVIS, assisted by L. Borchert, F. Elchbaum, E. Kugler, H. Toepfner, and other Experts. From the German by WILLIAM T. BRANDT, editor of "The Techno-Chemical Receipt Book." Illustrated by 28 engravings. In one volume, 12mo, 350 pages, price.....\$3.00

Free of postage to any address in the world.

ABSTRACT OF CONTENTS.

Chapter I. Historical Notice of Perfumery. II. The Perfume Materials for the Manufacture of Perfumery. III. Testing Volatile Oils. IV. The Volatile Oil Used in Perfumery. V. Resins and Balsams. VI. Perfume Substances from the Animal Kingdom. VII. Artificial Perfume Materials. VIII. Alcoholic Perfumes. IX. Dry Perfumes. X. Fumigating Essences, Pastilles, Powders, etc. XI. Dentrifices, Mouth Waters, etc. XII. Hair Pomades, Hair Oil and Hair Tonics, Hair Dyes and Depilatories. XIII. Cosmetics. Index.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

A circular of 2 pages quarto, giving the full Table of Contents of this important Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

PACIFIC ROLLING MILL CO.,

Cast Steel Castings and Steel Forgings

.....MANUFACTURERS OF.....

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

—ALSO—

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE and MARINE FORGINGS.

ALSO Steel Rods, from 1/4 to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogue. Address

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, May 12, 1892.

Continued cool weather has prevailed the past week. Moderately warm weather and clear skies are now wanted for growing crops, for the ground is well saturated and vegetation can do without rain from now on, provided the large growing sections of the State are not visited by north winds. The improved condition of the wheat crop has caused an advance in outward wheat charters. If the advance is sustained it will be the means of sending more vessels to this port with coal, iron and coke. General trade is said to be fair. The local money market is reported unchanged, as are the Eastern money markets.

SILVER.—The offering of bullion to the mint is larger than it was at any time last month. This causes some surprise, in view of a strong probability of more favorable action by Congress on the Free Coinage bill. All advices received from Washington, D. C., are confirmatory of some kind of compromise or combination by which a bill will be passed which will be more favorable than the one now in force. The action of England in accepting a bimetallic international conference is accepted as a long stride toward securing a general international bimetallic agreement. At the last conference, England's open hostility to bimetalism defeated an international agreement on the subject, but public opinion in that country appears to have since then undergone a radical change, for there is a growing demand for bimetalism. The fluctuating value of silver, on which fully one-half of the world's trade is based, has undetermined general trade and exchanges and has made everything unstable. Instead, as formerly, bearing the stamp of legitimate transactions. Besides this, by lowering the price of silver the purchasing power of countries using silver is greatly lessened, and consequently they are not as large importers of the products of gold countries as they were when silver was on a more even footing with gold. The low price of silver has enabled India to successfully compete in the markets of the world with many of her manufactured goods, cotton, etc., which builds that country up at the expense of the like industries in England and also in this country. A well known authority at the East on financial subjects says that at the beginning of 1872 silver stood at a premium of three cents above gold. Since then the course of silver, wheat and cotton were downward most of the time until the passage of the act of 1890, directing the purchase by the Government of 54,000,000 ounces of silver, and the issue of that amount of lawful paper money to pay for it each year. The passage of that act soon raised the price of silver from \$1 to \$1.21 per ounce; wheat from 85 cents to \$1.09 per bushel; cotton from 10 1/2 to 12 1/2 cents per pound, and thereby gave life to all legitimate business. To defeat these results, England issued paper rupees, redeemable in silver, and paid them out to buy wheat and cotton in India, and through such temporary expedients has succeeded in again putting down prices for silver and cotton, as she would the price of wheat had it not been for short grain crops in Europe and the present grain famine in Russia. The expedients, however, may yet prove very expensive, for if these results in her efforts at bringing about the repeal of the act of 1890 or prevent free coinage by this country, she must soon enter the markets of the world and buy silver to redeem her outstanding silver obligations.

MEXICAN DOLLARS.—Shipments the past week aggregate 64,502 dollars to Hong Kong and 89,000 to Japan. The latter country also took \$107,800 in silver bullion. The market for Mexicans is fairly steady.

QUICKSILVER.—Receipts the past week aggregate 44 1/2 flasks. The market is fairly steady.

LIME.—Receipts the past week aggregate 2405 bbls. The demand is fair for both home and export.

BORAX.—Receipts the past week aggregate 1080 cbs. The market is fairly firm with a continued free Eastern demand ruling.

LEAD.—The market is easier. Eastern advices report a weaker tone notwithstanding light stocks. Buyers are pursuing a conservative tone, and only place a good sized order when offered concessions. **TIN.**—Tin plate is going into consumption more fully. Canners think they will use more than they had expected. Pig is strong on this coast, at the East and abroad. The statistical position is strong. In April English spotstocks fell off 13 1/2 tons, or to an exceptionally low point, while there was a falling off of 37 1/2 tons in the quantity afloat for that quarter. On the other hand, American spot stocks are shown to have increased 850 tons and the quantity afloat for this country to have increased 135 tons. Looking at the returns from another point of view, it would appear that the bulk of supply is gradually being transferred from the English to the American market, although doubtless under former control. Thus the American visible supply has increased 535 tons, while the English visible has fallen off 1507 tons, in which changes the shipments of 1400 tons hence from England are a prominent item.

COPPER.—The market is firmer, with an upward tendency reported. *Iron Age*, May 8th, reports the New York market as follows: "Spot parcels of Lake Superior ingot are very difficult to obtain at less than 12 1/2 c, while near future shipments may be secured at 12c, and wire bars are held at a similar premium, say 12 1/2 c for prompt, against 12 1/2 c for future deliveries. Rumor goes so far as to state that available supplies of copper for export are insufficient to meet the demand, and that foreign consumers are actually discommoded for want of material."

IRON.—The market is steady, with no marked selling pressure reported. The consumption is large, but foundrymen's near by wants are said to be supplied. At the East the market does not show any material change. The consumption and production alike are large.

COAL.—Receipts the past week aggregate as follows: Comox 1500, Departure Bay 1000, Coos Bay 500, Seattle 2470, Tacoma 2160, Newcastle N. S. W. 2485; total 10,115 tons. The market is weak for household but firmer for gas and steam. Canneries starting up have enlarged the demand. Higher wheat charters at this port will probably attract more vessels to this coast. An explosion in the Roslyn mine, Washington, will curtail the output from that source, but with any appreciation in prices the output of the mines would be largely increased.

Mining Share Market.

SAN FRANCISCO, May 12, 1892.

Mining shares the past week surprised the street by an erratic move in Ophir and Mexican. On Friday the market closed weak and dull, but at the first session on Saturday shares in the above two mines doubled in value. The up move was unexpected, and the decline which followed so rapid they did not allow many outsiders to take advantage of the jump by selling. Other shares moved up and then down in sympathy from 5 to 25 per cent. There was nothing new from the mines further than had been published by the Press, to indicate the sudden jump, consequently it is only surmised as to the cause. The move so as to frighten outsiders from playing at the ring's game of selling short. Shrewd operators do not short now until there is a sudden jump, and then they put shares out only to be bought back on the decline which invariably follows. Among the very best informed there prevails a strong belief that the milling and stockpools are working the market

upward, so as to again get the public stock on "hype" at each set back for an up-turn. It is these purchases on a set back that allow insiders to get the best of outsiders and admit of their being able, after confidence is somewhat restored, to break the share market quick and to such low figures as not only to uncover shares on a margin but also get cash shares at low prices; but falling in this, levy assessments and keep shorting the market until outsiders are worn out and sell in disgust. Of course their dummy directors help them in the legal robbery by having all favorable news from the mines suppressed and only porphyry, water strikes and similar discouraging news officially reported.

The Mining Stock Association appears to have played into the hands of mine managers, when the Association turned the control of Savage over to J. L. Flood. Evidently, they were deceived into this by the Flood management of Hale & Norcross giving weekly reports from the mines, which conform to the law under which the companies incorporated. Perhaps it was the Brokers' Combine that forced the Hale & Norcross management to conform to the law, and not a change of heart on the part of the Flood combination.

There is a growing conviction among close observers of the work being done in the mines and also in the way in which the share market is manipulated, that the rings do not want moneyed men to enter the market as buyers at present, and everything that can be done is being done to keep them out. Of course, this does not apply to habitual traders, for the latter can be used by cappers and pointers. It is those who buy for investment they do not want in at present low prices. Whether the above views are correct, readers must be their own judges.

A. K. P. Harmon, 1st vice-president of the Hale & Norcross Mining Co., is president of Con. Imperial Mining Co., and yet in the month of April the net returns from the bullion extracted from the ore milled not only paid all mine expenses, but left a net balance of about \$150.

Do not the officials of the mines, of which the superintendents are also superintendents of the mill at which the ore is milled, know that they make themselves liable to criminal prosecution?

Is it not about time that the Mining Stock Association pay attention to the way in which the Gold Hill mines are managed? It is no secret that the mine managers say they are above the law, and that no power can reach them, and therefore mine-looting will not be given up.

The Brokers' Combine will contest for the control of Crown Point at the annual election to be held on June 6th. It will undoubtedly force the mill ring to enter the market as buyers, and when this is done, the outsiders will be able to sell out and buy back cheaper or at least this has been the case in all past contested elections.

The *Dayton Times* says that there are rumors afloat "to the effect that a mill may possibly be built at Sutro and the ore taken out through the tunnel. This method of extraction and transportation would be much cheaper than any other, and in a short time would save the price of the construction of a mill. Such a move would no doubt lead to other mines than the Con. Virginia shipping ore through the tunnel, and in time a number of mills might be at work at this place and Sutro."

It is now an open secret that one of the mill rings on the Comstock has bought the MacArthur Forrest process for the reduction of refractory and low-grade ore. By this process 95 per cent of the assay value of the ore can be saved. It is said that tanks for leaching purposes are being built.

The Hale & Norcross Mining Co. has moved into the office lately occupied by the Quijotoa mining companies. Before going into the new quarters, the rooms had to be purified, painted and made somewhat respectable.

Captain Voll, the veteran of Pine street, is again in the stock market. With his advent more life and livelier turns are the order.

The share market this morning was strong, with the middle stocks scoring a slight advance.

The Silver King Mining Co. has received returns from 9627 pounds of ore sent to the El Paso Smelting Co. The mill will soon be in running order, when it will start up on a large quantity of ore on the dump.

Advices from the Comstock mines report that active developing or prospecting work is being done in the Kenosha tunnel. The work in Mexican and Ophir is being closely watched. If the stock market gets into better position for handling, good news can be looked for from Mexican, Ophir and Con. Virginia. Several of the Nevada Middle mines is kept back; perhaps insiders do not wish the public to buy the shares for fear the present favorable conditions may not hold out. An assessment, it is said, has to be levied by Overman, one by Confidence, one by Challenge, one by Con. Imperial and one by Belcher, before the managers of these mines will be able to do much toward creating higher prices for the shares in the Gold Hill mines.

Eastern Metal Markets.

New York, May 12.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday.....	39 11-16	86 3/4	11 95	4 25	20 45
Friday.....	39 11-16	86 3/4	11 95	4 25	20 45
Saturday.....	39 11-16	86 3/4	11 95	4 25	20 45
Monday.....	39 15-16	87 1/4	11 95	4 25	20 45
Tuesday.....	39 13-16	87 1/4	11 95	4 22 1/2	20 55
Wednesday.....	39 11-16	87 1/4	11 95	4 22 1/2	20 65

Quicksilver is firm. Borax is in good demand at full prices. Copper appears to have a stronger tone. Pig tin is strong at an advance. Lead is weak.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight ruffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight ruffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

P. O. Address, South Riverside, San Bernardino Co., Cal.
CALALCO, Dec. 13, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

I am, my Dear Sirs, Yours faithfully,
S. HARRIS, Manager.

F. A. HUNTINGTON,

PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

The Sergeant Rock Drill.

The Sergeant auxiliary valve drill is, strictly speaking, a drill for hard rock. It embraces the independent valve operated through an auxiliary valve, and which contains a release rotation. These two features are the most important as distinguishing the Sergeant from other rock drills. The Sergeant, like the Ingersoll, strikes an uncushioned blow. The valve is held in such a position that while the piston carrying the cutting tool is moved toward the rock the exhaust remains open on one end, while the full pressure acts on the other end until the blow is struck, at which time the valve immediately reverses. There is no such thing in the Sergeant as striking a blow upon a cushion of steam or air in front end of cylinder. It must hit the rock and does it before the steam or air enters the front end. It does not use steam or air expansively, but has the benefit of full pressure to strike the blow and to recover from broken or crooked holes.

The Sergeant has an auxiliary valve operated by shoulders upon the piston. The auxiliary valve and its valve seat are entirely independent of the main valve and seat. The auxiliary is the trigger to the main valve. It opens or closes the steam or air passages, releasing the pressure from one end or the other of the main valve. The pressure bears it upon its seat; hence its wear is uniform and cannot produce leakage. The auxiliary valve being light, of steel, and moving on the arc of a circle through contact with the piston operating tangentially, it is easily moved, does not wear rapidly, and never breaks. It is inexpensive and readily duplicated.

Using a round piston, made of steel and hardened, fitting plug-like in the ends, a large opening is effected by a slight movement of the valve. Being perfectly balanced, there is little or no wear.

A short or long stroke can be obtained at will by turning the crank and feeding the cylinder toward the rock. This is a most important feature, and is applied to the In-

gersoll and Sergeant drills only. A short stroke is of great advantage in starting or blocking out holes.

A new rotating device with a release

ing the friction of the back head springs, when with a rigid rotation it might twist the rifle bar or break the pawls and ratchets.

Two strong steel springs are used in place

The Outlook for the Hydraulic Miners.

Mr. Luttrell, of the Hydraulic Miners' Delegation, sent to Washington to solicit from Congress aid in behalf of that interest, and who still remains at his post, the other delegates having left, still entertains the hope that Congress will vote the appropriation asked for, and recommended by the Committee on Mining. Should the sum so favorably reported be cut down, that gentleman believes that enough money will yet be given to warrant commencing the construction of the larger retaining dams projected. Once begun, it is thought that Congress will later on appropriate sufficient money to continue the work and carry it to completion. There is, therefore, a good prospect that this important industry will in due time be revived, to the great benefit of both the farmers and the miners and the general advantage of the country at large.

Per contra, Mr. Geo. Ohleyer, of the Sutter County Farmer, while he believes the bill providing for the improvement of rivers and harbors will pass Congress, thinks the prospects for the hydraulic bill are doubtful, going on to remark that if this sort of legislation is going to be entertained by Congress, it will, in his opinion, cause to be made such a searching examination of this debris question as cannot fail to result disastrously to the cause of the hydraulic miners. We had hoped there had come an end to these unfriendly insinuations and covert attacks upon an industry which, through the efforts of its friends and the partial relenting opposition of its foes, was staggering into life again. Not certainly during this season of truce did we expect to see this industry, so feebly

gasping for life, assailed with so much of acrimony as these givings out of Mr. Ohleyer would seem to imply. But then, something must be pardoned because of the malaria and the general discomforts of the Slough City; besides, our estimable friend George is naturally crabbed and pugnacious.

THE SERGEANT DRILL—WORKING CLOSE TO A WALL.

movement prevents twisting of the spiral bar or breaking of pawls and ratchets. When a rock drill strikes a hard blow upon an uneven surface there is a tendency sometimes to twist the steel in the opposite direction to that in which it rotates. The effect of such a blow on the Sergeant drill is simply to turn the back head around, overcom-

ing the friction of the back head springs, when with a rigid rotation it might twist the rifle bar or break the pawls and ratchets. These machines are manufactured by the Ingersoll-Sergeant Drill Co. The Parke & Lacy Co. are agents.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Ed.

The Cyanide Process.

SAN FRANCISCO, May 7, 1892.

TO THE EDITOR:—The learned and scientific account of the cyanide treatment that appeared in your issue of April 23d does not give much assurance that we have at last discovered an infallible process for the reduction of ores, whether high or low grade. Six dollars a ton is considered high grade these days, when there is enough of it, and the average yield of all our greatest mines, such as the Sierra Buttes, Plymouth, Keystone, etc., has not much exceeded that figure, at least in free gold. Mining is an expense that must be met, whatever the process, and while the cost of milling in some of the above mines has been as low as 37½ cents, the total expenses, independent of reduction, have been rarely below \$3.50 or \$4, and this with thorough equipment, and on an extensive scale. Now we find in your valuable article the quantity of cyanide necessary to treat a ton of ore will vary from 1 to 1½ per cent, or at a cost of nearly \$2 to \$8 per ton, without regard to other incidentals. How could our mines, the vast majority of which produce ores under \$8 a ton, be benefited by a process so dear as this? Mining would continue to cost from \$2 to \$6 a ton, and the dullest dolt would surely not give \$2 to \$5 more to get his gold by cyanide when he could secure it by milling, which would not cost over 50 cents or \$1.

Silver ores run much higher, as a rule, than gold, but here the process seems to be utterly at fault, as the investigations show it did not reach over 60 per cent of that metal. If a silver ore consequently assayed 100 ounces, the loss per ton by cyanide would be 40 ounces, while by roasting, chloridizing and amalgamation, it could be worked at a cost of \$6 to \$10 up to 95 per cent. If cyanide could be demonstrated to reduce sulphurets, it would be an inestimable boon; yet even here it would not apply in all cases, as some sulphurets run very high in silver, and the loss in that metal would exceed many times over the cost of chlorination. Cyanide is likely to have its day in the hands of professional enthusiasts, and then be relegated to obscurity, or to the treatment of those \$10,000 ores in Shasta county that one of your recent correspondents wrote about. People are constituted differently, but in regard to ourselves, we can say, emphatically, if we had a mine containing \$10,000 ores, we do not think we would ever have need of any process at all.

"PIONEER."

Heretical Geology.

BENICIA, CAL., May 14, 1892.

TO THE EDITOR:—At the lower end of the cascades of the Columbia river, on the south side, about four miles below where the locks are being built, there lie exposed the ends of the trunks of several trees of the species known in the lumber market here as Oregon pine. The conglomerate in which they are imbedded is entirely below high water mark. It lies level, covered by hard massive rock left overhanging by the erosion of the conglomerate. The tree trunks project in a horizontal position, some of them being about four feet in diameter. The wood has been changed to hard black stone, but the bark on some of them is so completely preserved in its original condition as not to be readily distinguishable from that of fallen trunks of the same kind of timber lying on the mountain side above. At this point, without any intervening tableland, the mountain rises abruptly directly from the water's edge in a steep declivity to a height of about one mile. I challenge any geologist to explain logically the occurrence of those tree trunks at the place and in the condition which I have described in harmony with popular geological theories.

One of the cardinal tenets of the geologist is the unalterable immobility of the ocean's surface level. Geologists assert that there never has been, neither is it possible, that there ever could have been any great change in that. Although every explored portion of the earth's surface, even the highest mountains, give conclusive evidence that it has at some period been beneath the ocean's surface, geologists aver that it has always been the result of alternate depression and elevation, a seesawing (so to speak) of the land surface.

By popular geological theories, that portion of the earth's surface where those tree trunks now lie must in some previous period of the world's history have existed at nearly the same level, with the same climate as at the present time. Then a sinking began, and was continued until about a mile in thickness of mountain material had accumu-

lated in the depths of the ocean on the prostrate trunks of those pine trees. Then the motion is reversed and the land rises until the buried tree trunks have attained nearly about the same level as that at the time of their growth. Then the river is set to work until it cuts through the route of solid rock down to the level of the tree trunks, the entire process occupying an interval of time amounting to one or two millions of years, more or less. The geologist is never niggardly in the use of time in the construction of his theories, for he always has ready an unlimited supply from which he may draw without stint. In apportioning time though for different phenomena, there is liable to be clashing, as, for instance, in the case which stated climate must have remained the same for a very long period, while other phenomena in geological science as taught require that there should be continuous change.

The true solution of the appearance and condition of these tree trunks found in the position which I have described is to record them as one of the results of a deluge neither remote in time nor of long duration, and when men of science become obliged to admit, as they surely will eventually, not only the possibility of a deluge but the probability that one has occurred very nearly in the manner described in the book of Genesis, the science of geology will be placed on a true basis.

JUSTIN CHENOWETH.

How Miners Can Get Fresh Water.

Mr. George W. Durbrow, manager of the salt works at Salton, passed through here Sunday on his way home from Los Angeles. He ordered thirty carloads of lumber for the erection of a new mill and other buildings at Salton. Mr. Durbrow now has gathered around the salt works about one hundred Indians, and he is taking great interest in improving the condition of these aborigines. A mile or so from the village he has developed quite a quantity of water, and here he intends to establish the older Indians, and induce them to plant vegetables, melons, fruit trees, etc. The water is perfectly good for irrigation; but there is too much salt in it to render it palatable for drinking purposes. Mr. Durbrow intends putting in a condenser for the use of the Indians, and they can then have all the fresh water they want. He gave us the plan of a very simple condenser, and if prospectors and others who frequent the desert will read this description and provide themselves with the following apparatus, there will be no further complaint of the unwholesomeness of the water at Chuck-walla and other places. Take an ordinary five-gallon coal-oil can, and have a small, curved spout, about two inches long soldered on top of it; have about 20 feet of very small rubber hose. Slip one end of the hose over the spout of the can, and connect the other end with another can similarly fixed, only at a lower elevation than the first can. Let the middle of the hose rest in the pool of water. Now fill your first can with water and build a fire under it. The vapor will pass through the hose until it strikes the part that is submerged, when the cold will condense it, and it will flow into the second can in the shape of as pure and sweet water as one could wish. We hope we have made this plain. The whole outfit wouldn't cost more than a dollar or two. The condenser at the Indian village will be on the same principle, only an iron boiler, one-inch pipe and a wooden tank will be used.—Banning Herald.

A MILL AT SUTRO.—The Dayton Times says: Since the burning of the Eureka mill the ore from the Con. Virginia mine is being worked in the Morgan mill at Empire. This is a steam mill, and it has not the capacity that the Eureka had, and consequently cannot handle all the ore coming from the mine. Neither can the ore be worked as cheaply at the Morgan. These facts have caused rumors to the effect that a mill may possibly be built at Sutro and the ore taken out through the tunnel. This method of extraction and transportation would be much cheaper than any other, and in a short time would save the price of the construction of a mill. Such a move would no doubt lead to other mines than the Con. Virginia shipping ore through the tunnel, and in time a number of mills might be set at work at this place and Sutro.

THE ELECTRIC ROAD.—Officials of the San Francisco and San Mateo electric road state that an additional power house is soon to be built, but the location has not yet been decided upon. The company is now running 15 cars, but in a short time the number will be increased by five. The company has given orders for 30 more cars, to be completed as soon as possible.

Varieties and Uses of Mica.

George P. Merrill contributes to *Stone* some useful information on the varieties of mica.

There are several distinct varieties of mica all characterized alike by a very perfect basal cleavage whereby they split readily into thin sheets, but differing in color, elasticity and composition. The most prominent varieties are (1) the white colorless variety, muscovite; (2) the white to yellowish brown or brownish red variety, phlogopite; (3) the black and frequently opaque varieties, biotite and lepidomelane and (4) the pink lilac or rose colored lepidolite. Of these only the white variety muscovite is, excepting as a rock constituent, of economic importance, and need be described here.

OCCURRENCE.—The micas are among the most common and widely disseminated of minerals, occurring in irregular shreds or six-sided tablets in rocks of all kinds and of all ages. They are particularly characteristic of the acid crystalline rocks, both eruptive and metamorphic.

The white variety is, however, much the more restricted in its distribution, and it is believed is confined wholly to the older acid rocks of the granitic or gneissic groups.

The prevailing form of the micas is that of small irregular flecks, from a mere point to a fourth of an inch in diameter disseminated throughout the mass of a rock. In the younger eruptives, in limestones, and in granitic veins it not infrequently shows good crystallographic forms hexagonal in outline, which are easily recognized as mica from their property of splitting readily into six-sided thin sheets.

The white mica, or muscovite (sometimes called isinglass) of commerce is derived wholly from pegmatitic or other coarse granitic veins in granite and gneiss. Besides mica, the chief constituents of the veins are quartz and feldspar, though there not infrequently occurs a pleasing variety of mineral, as beryl, tourmaline, apatite, cassiterite, etc. Indeed such veins are the mineralogists' most fruitful fields, both as regards abundance and variety as well as perfection of crystalline form.

PROPERTIES.—The distinguishing characteristic of muscovite, and that which gives it its chief value, is its property of splitting readily into thin, transparent, tough and elastic sheets. It is but little acted on by heat, though gradually becoming brittle on prolonged exposure to high temperatures.

USES.—The chief use of mica is in the form of thin sheets for stoves and furnaces. For this purpose it must be clear and free from bad spots, cracks or blemishes of any kind. The most desirable color is stated to be wine red. Of late years there has arisen a considerable demand for mica in the form of strips some eight inches long by one inch wide for insulating purposes in the manufacture of electrical apparatus. The qualities essential for these purposes are toughness and freedom from iron. There is a considerable and increasing demand for ground mica, which allows of the utilization of the scraps which must otherwise go to waste. At present eight grades are prepared, the coarsest being used to give a spangled effect to fancy grades of wall paper, while the finest is used in producing a uniform metallic white surface on the same. The intermediate varieties are used mainly in the manufacture of lubricants for heavy machinery.

PREPARATION.—Mica occurs in sheets of all sizes up to two or more feet in diameter and from the fraction of one to several inches thick. The larger sheets are utilized mainly for sheet mica, and for this purpose the blocks, after being taken from the quarry, are freed from all gangue material, split to such thinness as to trim readily, and by aid of patterns cut to standard sizes, the value of the cut sheets increasing very rapidly in proportion to their size. There is a great amount of waste in this process, and it is stated not above eight or ten per cent of sheet mica is obtained from the block mica thus treated. The waste material or scrap from the trimming, and in some cases the entire product, if sufficiently clean and free from gritty substances, is ground. This process, owing to the toughness and fissility of the mineral, is one of considerable difficulty, and at date of writing not more than two or three firms in the entire country are prepared to do the work.

SOURCES.—More or less mica has from time to time been produced by nearly every State bordering along the Appalachians, though the mining is nearly always more or less spasmodic and intermittent. Frequently, mica forms a product of the feldspar and quartz mines, though the amount thus obtained is comparatively small. New Hampshire and North Carolina are at present

the chief sources in the United States. From 40 to 50 tons are annually produced, valued at from 10 cents to \$5 a pound, according to quality. The chief foreign sources of mica are Canada and India.

Shasta County Mines.

A meeting of the Shasta County Miner's Association was held in Judge Bell's office Saturday last.

A communication from the State Mineralogist was read, in which it was stated that Mr. Hobson had been compelled to remain in Washington for such a length of time that it was improbable that he could spare time to write a report on Shasta county for the next State report. The letter further stated that there were no funds to employ anyone else and that the report would necessarily contain old data. Mine owners and others are requested by the executive committee to send short description of work actually done during the last 12 months, to the secretary of the county association.

Mr. Swasey said he expected that the room in the Masonic building would be shortly ready for occupancy.

Some fine samples of ore and a number of subscriptions were handed in.

Some new and valuable books on mining have been received and others ordered.

The question of giving financial assistance toward the delegation expenses at Washington was again brought up and the meeting was of the opinion that it would take all our resources to establish the local association on a sound footing, and that all moneys on hand were only available for putting up the bureau and making it a thoroughly representative exhibition of the mineral resources of Shasta county.—Shasta Democrat, May 11.

Mining in Tonquin.

Lieutenant P. Balagny, an officer of the French army, is at the Lick. He is en route to Paris from Tonquin, where he has been stationed during the past six years.

He says the most important enterprise in Tonquin, which is under a French protectorate, is mining, and, although only recently considered of much importance, has been rapidly developed of late. The population is so great in proportion to the size and resources of the country that the people are usually poor. The development of the mining industry, however, will provide employment for many of the natives, whose labors have hitherto been expended entirely in the growth of rice and tea.

Coal is regularly shipped to Hong-Kong, and 18 antimony mines have been opened within the past year. The deposits of both minerals are rich and extensive. Silver and gold is also present in considerable quantities, but in locations so inaccessible that they cannot be readily mined.

The mines are operated for the most part by companies of English and French capitalists, whose headquarters are at Hong-Kong. Lieutenant Balagny says that there are splendid opportunities for the investment of capital in these mines, and that a number of Americans are going into the country.

THE BANNER MINE.—From Col. Frank McLaughlin it is learned that he has leased the famous old Banner mine for a term of two years, with the privilege of purchasing it during that time. That mine yielded in pioneer days about \$700,000 from surface diggings, and has never been even prospected to any depth. The Colonel now has a force of men, with L. H. Ayer as superintendent, cleaning out the shafts, and is preparing to sink several hundred feet, or as deep as is deemed necessary. The Colonel thinks that he will develop one of the best quartz mines in the State. If so, it will be a great boom for the mines in that locality. The telephone line from the Colonel's office to the mine was completed under the supervision of Jos. Marks.—Oroville Mercury.

ENTOMOLOGISTS.—The California Entomological Society has elected the following named as officers for the ensuing year: E. M. Ehrhorn, president; W. H. Robinson, vice-president; Alexander Craw, secretary; C. C. Riedy, treasurer; directors—E. M. Ehrhorn, W. H. Robinson, Alexander Craw, C. C. Riedy, Prof. C. W. Woodworth and Prof. C. H. Allen.

At the annual meeting of the Maryland Gold-Mining Company, held at Grass Valley, S. P. Dorsey, L. V. Dorsey, William W. Young, R. Shoemaker and Charles H. Mitchell were elected directors. The board was organized by electing S. P. Dorsey, president, and L. V. Dorsey, secretary and treasurer.

World's Fair Queries.

Answers to Questions Propounded at the Recent Convention.

Answers in brief to the questions submitted to the California World's Fair Commission by delegates to the convention which was held in this city on April 20th and 21st, have been made as follows: The State commission will pay railroad transportation from all terminal points in California on exhibits for the California building that are accepted by the commission. All shipments will be made at the risk of exhibitors. Exhibits will be returned to exhibitors free.—All works of art, if accepted, will be by classification only, and will be exhibited in the California building.—The proposed plan for the California building has practically, but not officially, been accepted by the authorities at Chicago.—In the General Classification Department the California commission will furnish tables, platforms, etc., for the use of exhibitors. Application blanks for space in the California building will be prepared at an early date. Facilities will be given in this building for preserving, preparing and repacking exhibits. In the matter of cold storage for perishable fruits, no decision has yet been reached.—As to how much land at Chicago has been allotted to California for an outdoor display of horticultural, viticulture, and other exhibits, J. M. Samuels, chief of the Department of Horticulture, under date of April 12th, advises the State commission that the proposition is still open to California to use five acres for ornamental trees, shrubs, semi-tropical trees, etc., provided the State commission will indicate to him in detail what is wished to be exhibited thereon. It will be impossible for him to secure five acres in one body. Mr. Samuels writes that the grounds must be arranged with regard to harmonious effect as a whole.—After due consideration the State commission has decided to recommend what is known as the museum glass jar for preserving fruits. Intending exhibitors may correspond with the secretary of the State commission for sizes, styles and cost. Exhibitors must furnish their own jars. The California World's Fair Magazine for April contains an article from Prof. Hilgard on preparations necessary for the preserving of fruits in their natural state. Preserved and dried fruits can be sold at the World's Fair only on orders. No delivery will be permitted from the State building. The mining exhibit, while at Chicago, will be in cases provided by the State commission. Valuable specimens will be enclosed in a safe. Watchmen to guard exhibits will be employed both day and night. All displays will be insured, but the State will be liable only for the amount of such insurance. Special arrangements will be made with exhibitors of minerals in cabinets or specimens of great value. Counties are expected to aid in making collections of minerals.—Each county is expected to make an exhibit of its products at the proposed World's Fair exhibit of California in the Mechanic's Pavilion at San Francisco this fall. The State commission will select exhibits from this preliminary display, store them, and, at the proper time, transport them free to Chicago. It is not compulsory on the counties to submit displays for this preliminary World's Fair exhibit, but the State commission earnestly requests that such display be made.—The State commission hopes to secure concessions from the authorities at Chicago for the sale of California curios, woods, etc.—No literature, giving special features of any county, can be sold in the California building. The State commission will issue gratuitous literature. Free distribution of pamphlets will be permitted when of proper character, but copy should be submitted to the commission for approval. All literature should be attractive. It is possible that sales of California products may be permitted in the cafe, but no concession has yet been granted.—It is desirable for each county to prepare an exhibit of floriculture.—The Women's exhibit in the California building will be catalogued.—The State will arrange and care for exhibits in the California building during the exposition.—Although an appropriation for a general exhibit of the natural flora of the State has been made, it is desirable for each county to assist in making this exhibit a complete one.—There will not be a competitive department in the California building.—Powder or other explosive articles for display are prohibited by general rules. Acids and chemicals, not of an explosive nature, may be exhibited.—County associations may take charge of exhibits placed in department buildings for competition, subject to the rules of the national commission. No premiums will be offered for displays in the California building.—Counties will be allowed to carry out their accepted design in the ar-

range of exhibits, but at their own expense and risk; this, however, to be subject to the rules of the State board.

The Canadian Mineral Act.

The amendments to the mineral act, passed at the present session of the legislative assembly, although somewhat radical, will in the main be beneficial to both the prospector and the prospect buyer. By the changes litigation is made almost impossible, and the discoverer of a good piece of ground is in no danger of losing his just reward by being side-lined by the unscrupulous prospector who does all his prospecting around the office of the mining recorder. Following is the manner in which claims must be located on the amending act receiving the lieutenant-governor's assent, which will be some time next week:

5. Sections 14 and 15 of the said act are hereby repealed, and in lieu thereof be it enacted:

14. Any free miner desiring to locate a mineral claim shall, subject to the provisions of this act, with respect to land which may be used for mining, enter upon the same and locate a plot of ground, where possible, not exceeding 1500 feet in length by 1500 feet in breadth, in a rectangular form; that is to say, all the angles shall be right angles, but the lines need not necessarily be meridional. In defining the size of a mineral claim it shall be measured horizontally, irrespective of inequalities on the surface of the ground.

15. A mineral claim shall be marked by two posts, each post being at least 4 inches square and 4 feet above the surface of the ground. The posts shall be numbered 1 and 2, and upon each post shall be written the name given to the mineral claim, the date of the location and the name of the locator. Upon No. 1 post there shall be written, in addition to the foregoing: "Initial post," the approximate compass bearing of No. 2 post, and a statement as to whether the claim lies to the right or left of the line from No. 1 to No. 2. Thus: "(Name of claim)," "(Date)," "A. B.'s claim," "Initial post," "Direction of No. 2 northeast," "Claim lies to right (or left) of line from No. 1 post to No. 2 post." It shall not be lawful to move No. 1 post, neither shall it be lawful to move No. 2 post, except for the correction of distance by the provincial government surveyor. Nos. 1 and 2 posts shall govern the direction of one side of the claim.

(a) The owner of a mineral claim shall be entitled to all minerals which shall lie within his claim, but he shall not be entitled to mine outside the boundary lines of his claim, continued vertically downward.

(b) This act shall not prejudice the right of claim owners who have located there under former acts.

Another amendment stipulates that before a third location can be made in any mining division, the claim owner must have performed the assessment work on his two former locations. Another reduces the charge for recording assessment work from \$6 to \$2 50.

Shipments of Quicksilver.

During April the mines here mentioned shipped quicksilver as follows:

	Flasks.
Great Western.....	650
Napa Consolidated.....	450
Bradford.....	207
Sulphur Bank.....	130
Baker.....	8
Total for month.....	1,445

The fourteen hundred and forty flasks represent 110,160 pounds—an unusually large amount for one month's shipments. Much of this has come from the Great Western mine, which is rapidly piling up wealth for its principal stockholders—two or three men.

The output of the Bradford mine will soon be largely increased, as they have two new furnaces nearly completed, and we are informed that a third one is in course of construction. It is probable that for a few months after the new furnaces are finished, shipments from the mine will amount to from 800 to 100 flasks monthly.—Napa Calistogian.

TRADES unions must have been very strong even in ancient times, if we may judge by the unanimity of 20,000 mine workers striking for an increase of wages from 17 to 18 cents per day in 413 B. C.—just 2304 years ago—with the result of overthrowing the Athenian Government.

THE Southern Pacific Company is pushing the road from Bakersfield to San Miguel. One hundred men have gone to work on the road. They are principally carpenters and bridge builders.

An Unlucky Tunnel.

On the 12th inst. an accident occurred at Cherokee, 12 miles from Oroville, Butte Co. Three men, named Jack Powers Jr., J. C. Hall and L. P. Hall, were mining in an old tunnel when it caved and killed all three of them. The men have been quite successful lately, getting out in one spot \$1600. The Hall brothers are lately from Montana, while Powers was born in Cherokee. According to an account telegraphed to the *Chronicle*, the three young men undertook to clear out the tunnel for the Spring Valley Co. This tunnel was between half and three-quarters of a mile long, and at the upper end of it was a large cut about 75 feet deep and 100 feet wide. This cut was partially filled with water, and through the tunnel about 400 inches of water was running.

The tunnel was made through bedrock, but the upper end was soft rock, and had caved so that the upper part of the tunnel was filled with water. No one could be hired to remove the obstruction on account of the danger, but the three young men offered to make the attempt for a share of the gold that was contained in the flumes that ran through the tunnel. Of these flumes there were two—one two feet wide and one five feet wide. All three had worked in the tunnel for nearly a week, and they realized the extreme danger. They had gradually cleared away the lower part of the obstructions, and intended to place a charge of giant powder in the remaining one, with a long fuse attached, so as to give them time to get out of the tunnel.

In the morning they told the man in charge to turn into the cut 2000 inches of water, with the idea that when the rocks and timbers were shaken up by the discharge of the powder the water would force everything through the tunnel. It is believed they must have removed a rock or timber that held the jam before they were ready to explode the powder, and that the barrier gave way so suddenly that they were unable to escape.

No one knew of the accident or had any intimation of it till 2 o'clock in the afternoon, when a Portuguese who was working in the edge of the deep canyon below saw two human feet sticking up out of the debris. He had been at work but a short time, and had not seen or heard the rush of the waters down the canyon. He at once gave the alarm, and a large number of men hurried to the spot. They set to work uncovering the body, which was that of one of the Hall brothers. The body was completely nude except an undershirt, and this was pulled over his head.

While some were at work digging the body from the mud and gravel, others hurried down the canyon and found the bodies of the other two men doubled up among the rocks and timbers, but not covered with debris. Not a stitch of clothing, not even their boots, was left upon their bodies. Their heads and faces were badly cut and bruised, but their bodies were not much injured except that the body of one of the Hall brothers had the leg broken. The bodies were taken to the town hall, where they were prepared for burial.

The mine has caused a number of deaths. A few years ago four miners—Dennis Whalen, Ed Lewis and two Portuguese—undertook to clean the same tunnel, that had been stopped by a cave near the upper end. One of the men removed a rock with his pick, and the dam gave way, washing them all out of the tunnel, but neither was killed, owing to there being such a small head of water.

In the same tunnel another man broke his neck by falling down an incline, and one was drowned in a pipe. Four Chinamen were at one time killed by a cave in the mine. One man was blown to pieces with giant powder, one was blinded for life, and seven other men have been killed by caves or in other ways, making in all 17 men that have been killed in the same tunnel.

Gas for Smelting.

THE Boston & Montana Company Solve the Problem Successfully.

As is well known it has been the intention of the Boston & Montana Company to use gas in their smelting process, and for that purpose they built in their new smelter here a number of furnaces adapted to that fuel, and also erected the necessary generators. This enterprise was wholly an experiment. Had it failed it would have been a great loss to the company and would have necessitated the alteration of a large portion of their plant. The result of their experiments has justified their belief that gas could be used with smaller expense than any other fuel, and it practically settles the question for all time.

For some time past Superintendent Kle-

petko has been experimenting with various grades of coal to discover the best and cheapest gas producer. The first trial was with Sand Coulee lump coal and proved to be a failure. The gas could not be produced fast enough to be of any use as a fuel. Superintendent Klepetko then turned his attention to Lethbridge coal, but this, too, was useless as a gas producer. It began to look a little doubtful, when it occurred to Mr. Klepetko to try the slack from the Sand Coulee coal. The result was so successful that Mr. Klepetko feels that the problem of fuel for smelting is practically solved. The slack affords a large volume of excellent gas and its successful production is now merely a matter of detail.

In view of the fact that this slack is sold at the mine for only 25 cents per ton to private consumers, it can be readily seen that in large quantities its cost would be infinitely cheaper than any other fuel.—Great Falls Tribune.

A Strike of Green Oil in Kern.

The oil regions of this county for the past year have been persistently and steadily developed, says the Bakersfield (Kern Co.) *Californian*. Men have taken hold of the enterprise who are not only able to carry it on, but who, with business acumen, have recognized the rich rewards which could be obtained by careful and thorough development.

Well after well has been put down in the Sunset region, each one, until this last discovery, yielding a heavy black oil carrying liquid asphalt, and from the discoveries already made a profitable industry has been built up, of such extent, in fact, that the Southern Pacific Company has commenced to construct a new line of railroad which will command the fields.

But all the time the company operating in that region, being convinced that what is called "green oil" could be found, has been persistently hunting for it, and upon striking black oil would remove its derrick and boring apparatus to another place and try again.

Not very long ago, after making a careful study of the formations, the company decided to operate in an entirely different locality, and so commenced drilling at a place nearly a mile east of its former workings.

At a depth of 470 feet measures carrying green oil entirely free from liquid asphaltum were encountered with a heavy flow of water. The well was kept steadily going downward, and at last accounts was nearly a hundred feet in this oil-bearing stratum, and as soon as the water can be shut off the exact amount of the flow can be determined.

But the capacity of this one well cuts but a very small figure in the case, for quantity can be obtained by increasing the number of wells. Already, in fact, a second well is just entering the oil bearing strata and others will also soon be put down.

The grand fact of the strike is the quality of the oil. It is of a dark green color of about 18° gravity, and the tests which have already been made of it prove it to be the very best of the natural lubricating oils, equal in quality and value to the most famed products of West Virginia.

An expert who has been testing it during the past week has publicly stated that it is a most remarkable oil, not exceeded for lubricating and fuel qualities in any locality. It is already being used for fuel at the refinery in Bakersfield.

This strike, which has caused considerable excitement among those in town who have known of it during the past week, is on Section 28, in the Sunset district, southwest from Bakersfield, and is owned by Messrs. Jewett & Blodgett, and has been drilled under the supervision of W. E. Youle.

The second well, on Section 13, also owned by the same parties, is now down about 400 feet, and already shows a considerable quantity of gas, which is a very encouraging sign for oil in the near vicinity.

The present, as well as the prospective industries of Kern county, have now cheap fuel at their very doors, while the market for lubricating oil of such quality as this recent strike is as wide as the world.

A GOOD MOVE.—We are informed that Messrs. Cook & Hamlen are now making arrangements to erect two 12-foot arrastres about half a mile east of town—below the round house. This is a move in the right direction, and will be the means of causing more work to be done in the mines here, about than anything else that could be done. It will now be possible to work the low-grade ores of the district at a profit, and the work thus done may, and probably will, show to the world that we have one of the best mining districts in the State right here.—Hawthorne Bulletin.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH MINING NOTES.—Jackson Ledger, May 14: At the Pacific mine a winze is being sunk in the No. 2 level to a depth of 100 feet, for the purpose of testing the ore at that depth. This work is being done where that last chute of ore was encountered. It has been reported here that the Clinton Consolidated Co. will soon be interested in this district in mining. The company's managers have been over and viewed the Alpine and Thos. Bawden claims, adjoining the Pacific mine on the east. Both are patented properties.

GOLD MOUNTAIN M. Co.—Ledger, May 14: The Gold Mountain M. Co. are pushing the improvements along. Charles Dickerman and Bob Lute will soon have the tramway completed. The ditch, under the management of John Madden, is fast nearing completion. Wm. Ford is rushing the ore out of the mine. The 20 stamps are kept right up to their full capacity. This unusual storm has retarded operations to a considerable extent. The old mountain is attracting considerable attention. Phipps, Vaughn and Dunbar are kept busy making improvements around the mill.

THE GOVER MINE.—Drytown Cor. Sacramento Union, May 14: People are building strong hopes on the recent developments and consequent activity in this mine. Among the important improvements, the hoisting works are being remodeled and self-dumping skips of two-ton capacity are going in. So far down as the 1000-foot level the mine has been thoroughly opened, and a new shaft is already down 80 feet below that level. Great ore reserves are being found on every level as they are opened out. The ore along the great mother lode of Amador county uniformly shows an improvement as lower levels are reached, and this is no exception. The Edison General Electric Co. of New York established their first plant in California for pumping mines by electrical machinery at the Gover.

Calaveras.

S. S. VALLEY MINES.—San Andreas Citizen, May 14: Among the mines now being prospected in the Pine Log district, in Salt Spring valley, is the Montezuma, owned by J. Womble, who has also the Gibraltar, an extension to the Pine Log group. They show gold wherever prospected by pan on top. The ledges, ranging from two to ten feet in width, have been mined in early days, giving fair returns with insufficient machinery. Last year 300 tons were taken to Copperopolis for flux, thereby increasing its value by gold from the quartz, which prospected several dollars to the ton, and was taken indiscriminately from several places and given to the Copper Co., which was so well pleased that it offered \$3000 for the claim, which was refused. He now has men at work sinking a shaft to strike the vein at a point 50 feet below the croppings, which is known to be good milling rock. The veins can be traced at least 5000 feet, running southeast and northwest, with dip to east; are encased in talcose slate and sandstone, the geological formation being excellent for pay, giving sulphurets of value up to \$300 to the ton by test, besides the free gold.

El Dorado.

BRANDON DISTRICT MINES.—Placerville Republican, May 12: The Oro Fino mine is pounding away with five stamps. At the Vandalia mine they are still operating on the tailings with the cyanide process. L. H. Brandon and C. N. Turnhoo are working in the tunnel of the French Creek gold mine and getting out ore. It is reported that a party from San Francisco has been examining the mine.

Humboldt.

MINING ON THE SOUTH FORK.—Willow Creek Cor. Blue Lake Advocate, May 14: Mr. Williams, an expert in the interest of a London syndicate, visited the mining ground on South Fork, and was very favorably impressed with the country. An expert in the interest of a San Francisco company is expected to visit and make a report on the Willow Creek ground. Mr. Van Vactor, an expert sent several months ago to make a report of the mines here, says that the ground will pay more to the cubic yard than that in Nevada and Sierra counties. One advantage these mines possess over those elsewhere is that there is no pipe clay to work through. Mr. Van Vactor, in his researches, found that there were three washes of gold. On the low alluvial ground, the fine gold is found; a little higher up, coarser gold; and on the high ridges, the very coarse gold. The existence of a high wash has been verified by the gold found in the Poor Man's Friend mine. Several settlers have worked their claims for the last few years, and have made fair wages. That does not signify that there is no rich dirt here. The miners have mined with giants, having only a small head of water and insufficient pressure, and used sluiceways and riffles of 30 years ago.

Nevada.

QUARTZ MINING AT COLFAX.—Grass Valley Tidings, May 13: The Big Oak Tree Mining Company, owning a quartz claim adjoining the Rising Sun at Colfax, will start work on the property about June 1st. Last week the company bought 12½ acres of ground adjoining their claim from Mrs. Huhley and Mrs. Meyers, paying \$60 per acre. Work on the Rising Sun has been in progress about a month. It is proposed to run a drain tunnel from Bear River to tap the shaft at a vertical depth of 400 feet. The tunnel will be 1800 feet in length, and miners say it will be quite a costly piece of work.

PENNSYLVANIA MINE.—Telegraph, May 12: Superintendent John Eddie brought some ore

to town from the Pennsylvania mine, and it was about as good looking quartz as is generally seen. The ore came from the north drift of the 400 level. Free gold could be seen all through the rock.

CHAMPION M. Co.—Herald, May 12: The Champion Co. has declared a dividend of ten cents per share, aggregating \$3500. Work will be immediately commenced to put in 15 new stamps. They will then have a 25-stamp mill.

PEABODY MINE.—Grass Valley Union, May 15: The water has been pumped out of the Peabody mine to the 400 level, and the work of drifting and stopping on that level resumed. The new 12-inch pump works well, and has done away with the necessity of pumping through the old incline. An auxiliary pump is being put in place below the 400 level, which will pump up the water to the tank on that level, from which the water is raised to the surface by the large pump, and then the sinking of the shaft will be resumed. The present depth of the shaft is 430 feet. Good milling rock is now coming from the 400 level and stopes.

PHILIPS HILL GRAVEL MINE.—Nevada City Herald, May 14: The drift mines owned by Charles Phelps of Phelps Hill, embrace 160 acres of valuable mining land, well timbered, and contains an abundance of free water supplied for mining purposes from never-failing springs. This mine paid well in the good old days of hydraulic mining, and to-day it is paying well as a drift mine. Mr. Phelps undoubtedly has the channel that begins in the vicinity of Bear Valley, passes to Alpha and Omega, thence to Phelps Hill, Relief Hill, North Bloomfield, Lake City, North Columbia, Cherokee, San Juan, and thence farther down the ridge. The claim is developed by means of two tunnels, one of which is in 130 feet, and the other 250 feet. These tunnels are run in two different channels, or rather, one large channel that has split into two different water courses that come together above and below the Phelps claim. One peculiarity of this mine is that it contains a great deal of chrome iron, to which is attached gold and pure copper. The gravel is mostly blue and easily worked. The tunnels run up the ancient river bed, so that they will never, as miners say, "Run out of fall."

THE CENTENNIAL.—Virginia Enterprise, May 11: Superintendent Richards writes that he has suspended advancement in the face of the main tunnel for the present. It is in about 2300 feet. The gravel belt being developed is merely a few feet above the roof of the tunnel and shows well, but the proposition of the management is to proceed forthwith to utilize the rich gravel developed last fall. With this view, crosscutting from the chief upraise above the tunnel is being done, extracting the gravel for washing as soon as the proper sluices and other outside works can be constructed. Snow and bad weather generally interfere at present, and the roads in all directions are demoralized, but as the good season opens all difficulties will be obviated, and golden success must infallibly follow.

THE GOLDEN GATE MINE.—Grass Valley Tidings, May 13: The Golden Gate, comprises a mountain of quartz about three miles south of Limekiln, in Wolfe district. Mill tests of the ore have developed that it will yield from \$6 to \$8 per ton, and it can be cheaply extracted by tunnel. There is some talk on the part of the lessee of operating the mill to be erected by electricity, the dynamo to be located at a point three miles distant, where water power is available. There is in the claim one of the finest deposits of pottery clay to be found in the State, and this, too, Mr. Hardy proposes to develop. Were transportation facilities at hand, this deposit would of itself be immensely valuable.

THE YELLOW DIAMOND.—Nevada City Herald, May 12: Work is progressing favorably at the Yellow Diamond, which was recently purchased by Washington, D. C., parties. Buildings have been erected, the tunnel has been cleaned out and retimbered, and the place is a scene of activity. The Yellow Diamond people have no further development work to do, as the ledge is in sight and there are about 50 tons of ore on the dump. Ground will be broken for a mill some time this season.

A BIO STRIKE.—Nevada City Telegram, May 10: The Harmony people are jubilant, and they have a right to feel so. A few days ago they ran into gravel that will pay on an average at least \$20 to the carload. A chunk of bedrock was brought into town on Saturday, and it was literally lousy with gold. The gravel is said to be the richest ever seen in this district.

Mono.

THE BODIE CON.—Bodie Miner, May 13: During the past week east crosscut No. 1, 700-foot level, was extended 10 feet. East crosscut No. 1, 550-foot level, was extended 12 feet. The ore stopes above 500-foot Jupiter shaft level are looking about the same as last reported.

THE MONO.—During the past week north drift No. 2, 600-foot level, was extended 9 feet. We are stopping out ore, north and south from No. 1 winze. Below 700-foot level the ore stopes are looking about the same as last reported. The mill has been kept running steadily. Average battery samples, \$39.62; average tailings samples, \$7.27.

San Bernardino.

MINING ABOUT THE NEEDLES.—The Needles Eye, May 10: The Brown gold claim is looking splendid. Frank Howard, Bob Irwin and Jimmy Coates have what promises to be something good in their claim, which they call the Alliance. The surface rock went 10 ounces, and the ore two feet down assayed 20 ounces of silver to the ton. Pres. Brown of the Mnsic Mining Company, accompanied by Mr. Hollaway and Mr. Max W. Hardee, came down from Hackberry last Saturday, bringing test samples from that camp for the Needles Reduction Company. It is reliably reported that Messrs. Harshberger and Gill have struck it rich in the

Pittsburg neighborhood. They have a claim about 1½ miles southeast of the Pittsburg, which assays 2565 ounces of silver to the ton. Their claim is called the Mattie Ellen. The Pittsburg grows better every day, and Messrs. Hyde and Hutt have ore always on hand ready for shipment. The Pittsburg is being worked by a force of men under a skillful superintendent.

San Luis Obispo.

NEW MINING DISTRICT.—Paso Robles Moon, May 14: About two months ago, as H. W. Neville and John Bogley were passing through the hills beyond Adelaide, they discovered a ledge of mineral, the outcroppings of which gave evident signs of being rich in both gold and silver. Specimens were secured and quietly sent to San Francisco for assay, and the returns which were received in due course of time, proved the quartz to be worth \$6.20 in gold and \$24.18 in silver. Feeling confident that they had made a discovery that was worth something, they associated themselves with Otto Shackelford and Bert Bray in this city, and laying claim to all that the law would allow them they immediately proceeded to develop the mine. A force of men was employed to drive a tunnel and the work is now progressing satisfactorily. The workmen have now reached the hanging rock which walls in the ledge, and are preparing to drill and blast it away. When this is done the owners hope to have revealed to them a ledge rich with the precious metals.

Shasta.

IRON MINES.—Cor. Redding Free Press, May 14: The iron mines of the McCloud could furnish, with suitable works, the entire State with railroad iron, and all our gold and silver mills with their machinery. And it is the northern mineral belt, on every section of which one mineral or another can be found, that in time will be the consumer of mountains of manufactured iron. The iron mountain of Missouri 50 years ago was the counterpart of the McCloud iron mountain of to-day. The iron mountain of Missouri now is estimated in value by the tens of millions of dollars, and what we see in future will be that of the northern deposit.

Tulare.

OIL WELLS AT COALINGO.—Hanford Journal, May 10: A gentleman recently from Coalingo informs us that in the oil region, ten miles from Coalingo, two good oil wells have been sunk and boring for a third has been commenced. One of them flowed not only oil, but artesian water, and is 700 feet deep. The top of the well is 800 feet above Coalingo, and the water is as salty as brine. The oil has to be pumped from the wells, as it does not flow over the pipe. An engine is used at one well and a windmill at another. The flow of the former is shut off for the present, but the windmill is still at work.

Siskiyou.

THE BALLARAT MINE.—Yreka Telegram, May 13: The Ballarat Co. is running a double shift, and is pushing operations as vigorously as possible. Bedrock was struck some days ago, and showed very favorable indications, although some distance from the main channel. A tunnel, or a series of tunnels, is being run out, by which means the channel will be intercepted, and good pay will certainly be the result. In a short time new machinery, including a new engine and better pumps, will be put in, enabling them to dispose with the large volume of water with more ease than at present, although the large thrashing engine now in use does very serviceable work. As soon as possible, a larger force of men will be employed, by which means work will be greatly facilitated, for at present the space in the shaft being so limited, only a small force can be utilized. Although too high upon the rim, very good prospects are being found, indicating better pay in the vicinity of the channel.

HUMBOLDT MINES.—Cor. Yreka Telegram, May 13: Mr. Marion has had a crushing from the famous old Craggy mountain, which paid exceedingly well. Marion will put on more men and develop the mine to a further extent, he being a mining expert and a capitalist. He also has several placer mines on Shasta river which he intends to work. Rabbitt & Co. are taking out some fine ore on the Schoolhouse ledge. Cartwright & Phillips are taking out some fine ore at a depth of 300 feet.

QUARTZ.—Yreka Journal, May 11: We were shown a solid gold specimen yesterday by Chas. Ross, who works in the North Star ledge of Boyle & Co. at the head of Humboldt creek, which weighed \$54. It was found about 110 feet underground, by Dick Wright, and exhibited a mark where his pick struck it. Dick thought it was a piece of copper, when his pick struck, but on examination, found a gold specimen, and managed to save all entire but a little thin piece. Dick was highly complimented by Mr. Boyle, for his faithfulness in working the claim, as a young man worthy of trust in any position. The quartz in the tunnel contains very rich specimens occasionally, which can be picked out by hand without the necessity of crushing. Judge E. V. Spencer continues to find good paying quartz at his ledge on Humboldt creek, but as he gets deeper down, has more sulphurets, from which it is difficult to save the gold in milling. He has also another good ledge on Humboldt Gulch, a short distance west of Yreka, which prospects well, but contains sulphurets in large quantity. Both these ledges are worked day and night in getting out quartz, and the judge intends shipping a carload of sulphurets from each to the Selby Chemical Works at Port Costa for testing, as the assays made of specimens from each show that the quartz is exceedingly rich. The Humboldt creek quartz assays over \$300 to the ton, and the Humboldt Gulch quartz about \$400, while the sulphurets contain a still greater amount of gold. The Allen Bros. of Quartz Valley have made a good run at their quartz ledge lately, the quartz paying from three to four ounces

per ton. Their ledge varies in width, but will average from 14 to 16 inches. They are getting their mill fixed up in good shape to do still better work in crushing ore. Owing to the cool and blustery weather for the past week or more, the snow has not been melting on the mountains; consequently the hydraulic miners have been unable to do much work in sluicing down the gold banks. As soon as the weather gets warm, as it certainly will be very soon, there will be an abundant supply of water, with plenty of snow on the high mountains to last nearly all summer.

Trinity.

NEW RIVER MINING NOTES.—Weaverville Journal, May 14: The Sherwood mine is opening up well under the lease now working. J. C. Leas and Thos. Nicholson made a clean-up the other day of \$1600, and have ore on the dump for about \$4000 more. Miller & Stone also have out a lot of ore from the same mine that is good. Miller has a two-stamp mill on the mine for crushing the ore; it will crush about four tons per day. Ladd & Clements have a ditch of water on the Boomer mine, washing the tailings; it is paying well. Colgrove, on the Excelsior mine, is taking out some good ore which shows plenty of free gold. Steve Noble & Sons, Clark & Shock and Mr. Parry, on Pony creek, are doing well. Now and then they take out nuggets that make one think of the "good old days of '49." It is reported that the Ridgeway will start up soon. Geo. Dean, who is in charge, has gone to Humboldt county for some castings for Miller's mill.

Tuolumne.

MINING NOTES.—Sonora Union-Democrat, May 14: The coming season promises to be one of unusual activity in mining circles. Many old mines are being reopened and new ones developed. Rich ore bodies are being laid bare in some of our larger mines, and the outlook for successful mining operations is very gratifying. Operations on the world-famed Bonanza mine will shortly be resumed. A large boiler—comparatively new—was used on the Heslep mine at Quartz Mt., has been purchased and placed on the Bonanza. Two new air compressors have been purchased, and they will soon arrive from San Francisco. Six men are employed doing necessary preliminary work to put things in shape to run the mine properly. In two weeks all the necessary machinery will be in position. The mine is full of water, and another two weeks' time will be occupied in removing it. The Black Oak mine has been temporarily shut down. This is an excellent property, and the well-known richness of its ore will prohibit long idleness. Considerable development work will be necessary, when an unlimited quantity of high-grade ore will be encountered. We are informed that a large body of ore, rich in quality, has been struck in the Buchanan mine. Mr. John Gibbons of Chicago and Mr. Mullen of Denver arrived to inspect the Garibaldi mines, situated on the Stanislaus river, where development of ore has been under way for several months past under the direction of Mr. Louis Blanding. Should the mines suit them, as probably they will, a large plant will be erected to work the ores. They were greatly pleased with the location of the mines and the fine water power, whereby the ores can be mined and milled very cheaply. Mr. Gibbons is a leading lawyer of Chicago and editor of the Chicago Law Journal. Mr. Mullen is largely interested in the silver mines of Colorado.

Ventura.

OIL MINE NOTES.—Santa Paula Chronicle, May 10: H. A. Clayton of Nordhoff has leased his land to a Los Angeles company, which will at once put down four wells for oil. The new well being put down on the Robinson lease is now 490 feet in depth. At Four Forks well No. 4 is down 1250, with good oil prospects. At the junction, well No. 4 is to a depth of 600 feet, and is still going deeper. Well No. 1, Pierre lease, has been abandoned and a new location has been selected. They are now drilling in one of the wells in Adama canyon at a depth of 2230 feet. This is said to be the deepest oil well in Southern California. The operators went through 250 feet of a peculiar, light green oil—a kind they have not before seen. A high oil well has just been struck on W. S. Chaffee's place in Torrey canyon. It is reported as being a 60-barrels-a-day well. Well No. 3 on the Robinson lease at Bardsdale struck oil at a depth of 460 feet. The output is about 40 barrels a day. From Chester Brown we learn that they are putting a fine steam engine on top of the mountain at Bardsdale. It is the design to thus have power to furnish all the wells in that vicinity by this one engine. A good deal of excitement now prevails about oil claims near Bardsdale. The leases are being taken rapidly. Well No. 2 at Four Forks is being cased at a depth of 1240 feet on account of caving in. No. 27 at Adams canyon is now down 2400 feet. No. 2 at the Junction is now at a depth of 550 feet.

NEVADA.

Comstock District.

CON. CAL. & VA. MINE.—Chronicle, May 14: 1500 level.—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. From the upraise which was carried up from the end of the crosscut run west 36 feet in from the main south drift, 155 feet south from the shaft station, we have continued to work upward and to extract ore of fair quality. 1600 level.—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted; add on the east side of the old stopes timbers we have found some ore of very good quality. 1650 level.—Have continued prospecting west from the upraise, 35 feet above the sill floor, which was carried up 50 feet above the southwest drift. Ore of fair quality has been

extracted from the drift run east from the Winze No. 3 (down 73 feet) in working upward from that point. From the north end of the California ground on the west side are working on the old stopes and extracting therefrom some ore of fair quality. 1750 level.—In east crosscuts No. 1 and No. 3 from the main south drift have continued to extract some milling ore. 1800 level.—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level we have continued to extract some ore from the sill floor upward of milling value. In the drift run north from the same east crosscut, at a point 60 feet north from that crosscut, are putting in square set of timbers and extracting some milling ore therefrom. There has been extracted from all parts of the mine during the week 1086 1430-2000 tons of ore, which was shipped to the Morgau mill. The average assay value of the ore worked at that mill during the week, 980 tons, was \$24.52. Bullion shipped to the Carson Mt. assay value, \$4243.29.

OPHIR.—1465 level.—In working easterly from the mouth of the north drift, from the drift run west from the winze 122 feet below the sill floor of the 1300 level, we have extracted and raised to the surface 25 tons of ore, the average assay value of which is \$26.62 per ton. The drift running south 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, has been extended during the week 23 feet; total length 37 feet—the last 30 feet being in the Ophir ground. Fifty tons of ore have been taken out from this drift and stored in the mine, the average assay value of which is \$19 per ton. The face of this drift is in porphyry and quartz of lower value.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift from S. N. M. & Union shaft, 900 level, was extended during the week 33 feet, making total distance west of shaft 1963 feet; face in porphyry.

UTAH.—From the west crosscut, at a point 595 feet from the shaft, the north drift has been extended a total length of 118 feet, continuing in vein porphyry showing in narrow streaks of quartz and clay separations of low assay value.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 33 feet; total distance west of shaft 1963 feet; face in porphyry.

ANNES.—On the 420 level west crosscut No. 3 from North drift on east side of ledge advanced 25 feet; face in clay and porphyry.

BEST & BELCHER.—900 level.—East crosscut No. 1 has been advanced 19 feet through porphyry; total length, 114 feet. Have done some work repairing in west crosscut No. 1, also advanced it a distance of 8 feet; total length, 222 feet; face in porphyry and quartz giving low assay value.

GOULD & CURRY.—200 level.—Northwest drift, 435 feet west of shaft, has been extended 18 feet, through porphyry and stringers of quartz; total length, 271 feet. 400 level.—East crosscut No. 1 from northwest drift has been extended 10 feet; total, 36 feet; face in hard porphyry. On Sinto Tunnel level the joint north drift with Savage Company has been advanced 23 feet; total length, 451 feet; face in porphyry.

HALE & NORCROSS.—On the 900 level are stopping ore from above this level. Winze from this level near our north line was sunk during the week 15 feet; total depth, 100 feet. It connected with the ore stopes above 1100 level. This connection will enable us to do considerable prospecting between 900 and 1100 levels. Hoisted from this level during the week 211 cars of ore. 1100 level.—We are taking out ore from above and below this level. Hoisted from this level 271 cars of ore. 1300 level.—East drift near the incline extended 20 feet; total length, 35 feet. No work is being done on the 1500 and 1600 levels by this company. Have men on repairs where needed in the mine. Hoisted during the week 482 cars of ore. Shipped to Brunswick mill 431 1680-2000 tons. Average assay of railroad-car samples of ore shipped to Brunswick mill for week, \$23.03. Battery assay for the week, \$15.36 per ton.

CHOLLAR.—Are repairing the north drift on the 450 level. We are putting the north drift on the 950 level in working order, preparatory to crosscutting on that level.

BULLION.—The joint Potosi winze is down 281 feet below the 1500 level; bottom in porphyry and quartz. The east crosscut, 320 feet south of north line, 1300 level, is out 120 feet, the last 85 feet in quartz yielding low assays. South drift, at a point 85 feet east of the west boundary of the quartz is in 29 feet; face in quartz. The east crosscut, 340 feet south of north line, 1500 level, is out 113 feet; face in porphyry. The joint northwest drift from the 1800 level of the Ward shaft has been cleaned out and repaired a total distance from the shaft of 300 feet.

WABN COMBINATION.—The joint Alpha and Exchequer south rift from the north line of Exchequer, 1800 level, has been extended during the week 25 feet through a mixture of quartz, clay and porphyry. The joint northwest drift from the 1800 level has been cleaned and repaired a total distance from the shaft of 300 feet.

POTOSI.—The winze is down 281 feet below the 1500 level; bottom in porphyry and quartz. Extracted and sent to the mill in the past week 393 1100-2000 tons of ore from the 930, 1100, 1150 and 1250 levels. At hand at mill, 95 1300-2000 tons; average battery assay, \$24.65. The northwest drift from the 1800 level of the Ward shaft has been cleaned and repaired a total distance from shaft of 300 feet.

ALPHA.—The Exchequer and Alpha south drift from the north line of Exchequer 1800 level, Ward shaft, has been extended during the week 25 feet through a mixture of quartz, porphyry and clay.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level, Ward shaft, has been extended during the week 25 feet through a mixture of quartz, clay and porphyry.

OCCIDENTAL.—The west crosscut from the south drift, 400 level, is in 401 feet; face in stringers of pay ore. The south drift from said crosscut is in 27 feet; face showing a small seam of pay ore. The north drift from same crosscut is in 34 feet, showing a little pay ore. The north drift, 450 level, is in 84 feet, showing fair milling ore.

CON. NEW YORK.—The north drift, No. 1 crosscut, is in 13 feet in ore yielding fair assays.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 730 feet; face in gypsum and porphyry.

Kennedy District.

AN INTERESTING LETTER FROM AN OLD ESMERALDA MINER.—Cor. Esmeralda Bulletin, May 11: Kennedy district is situated in the southeast corner of Humboldt county and about 60 miles south of Winnemucca, three miles from the west side of Pleasant valley, in a low range of mountains. The formation is a soft granite or gneiss, as some call it, with quartzite running through it. The ledges run north and south, dipping west at an angle of 30 to 45 degrees, and are well filled in between walls with talc and porphyry. The ledges range from one to four feet. The Cricket (the original location in camp) has a ledge ranging in size from 10 to 30 inches of ore. There is a tunnel in on it 150 feet, with pay ore the entire distance. The assays run from \$30 to \$180 gold and silver, with 100 tons of ore on the dump. This ore is highest in silver—from \$15 to \$25 gold. The Imperial is a larger ledge, and it is the best property in the camp. It has a ledge 18 inches to 34 feet, with a shaft down 40 feet, through ore the entire depth, with a tunnel started 150 feet down the mountain, which is in 70 feet, running for the shaft and running through ore the entire length. This ledge runs \$20 to \$160 gold—\$20 to \$200 silver. Kennedy has just received returns from some ore he shipped for a test sample of three different lots. The lowest was \$16 gold, 45 ounces silver; the highest \$81 gold, 38 ounces silver. The ore all carries from 10 to 50 per cent lead. He has now on the two dumps 170 or 180 tons of this kind of ore, with an ore chute 150 feet ahead of the tunnel, that crops out as prominently as that where he has run, making it continuous for over 200 feet, with the ore increasing in value and ledge getting larger as we gain depth. There is also a tunnel in 185 feet that will tap the ledge over 200 feet below the shaft, which will develop the property pretty well when it is in to the shaft.

St. Louis District.

MINING NOTES.—Cor. Esmeralda Bulletin, May 11: Joe Gilbert and Jerome Farrier last week uncovered a body of ore on their extension of the St. Louis lode, at a depth of 40 feet from the surface, fully equal to the high-grade ore characteristic of the district. This find is regarded as important, not only to the fortunate owners and as an additional evidence of the hidden wealth of the district, but to prospectors, as it explodes the theory of snides, claiming to be experts, who hold that quartz ledges maintain a uniform course. The St. Louis crops out and is easily traced the entire length of the claim, but little beyond. Acting upon that theory, Gilbert & Farrier sunk a shaft 100 feet; no ledge found; they then sank on "indications" some considerable distance off the trend of the St. Louis, with the result above stated. Jack Manny and M. Walsh have the chief mine yet opened in the district. They have about 25 tons of ore on the dump—eight tons first-class sacked and ready for shipment. The Plamenez Company is preparing to work the St. Louis claim on a larger scale than formerly. Good ore is being taken out of the Sprat & Tracy ground by lessees. This district has a bright future. Its area covers Tule Canyon, noted for its placers. At the State Line (eight miles distant), R. H. Stewart, keeper for George Crocker, is taking ore of high grade from one of the groups of claims formerly owned by the State Line Company. At Gold Mountain, Dutch Chris, the proprietor of the principal mines and steam arrastre, having fortified himself with a stock of supplies, will start up business at once.

Ferguson District.

ACTIVE PROSPECTING.—Pioche Record, May 12: Reports from Ferguson show that active prospecting still continues and new locations are made every day and in every direction from the first mines discovered in the district. This shows the existence of a very large mineral belt in that vicinity, and supports the judgment of nearly every man who has visited there that the district is bound to be a big producer. The first locators are getting down to work also. Jas. Hutchinson, a mining man from San Francisco, has bonded the properties of Samuel Reed, and will proceed at once with development work. After a stipulated amount of work is done, Reed is to convey to Hutchinson eleven twentieths of the whole, and a corporation is then to be formed. The April Fool claim still continues to develop and hold its own as the richest mine so far found in the district. The owners can't be touched yet on the matter of selling. The claim of John Vietti does not look so well as it did last week, a lime horse having been struck, but the formation leads to the belief that the ore body will come in again as strong as ever in a few feet. Gov. Goodrich and Henry Tracy have located three claims on a big ledge three miles north of the Magnolia, the surface croppings going \$15 a ton in gold.

Pioche District.

SMELTERS GETTING READY.—Pioche Record, May 12: Everything at the smelters points to an early resumption of business. The boilers have undergone a thorough cleaning, and everything around the works put in good running order. About ten men are employed, and as soon as the refinery is finished, it is calculated to start up the works to their full capacity.

MINING IN SOUTHERN HUMBOLDT.—Cor. Winnemucca Silver State, May 13: Unionville is

very quiet just at present; the Arizona mine has been shut down for some time, but they expect to put some men to work soon. I. M. Springer and J. C. Campbell are working placers below the old Pioneer mill. The boys have been prospecting for about eight months and have at last struck a place which bids fair to pay them well; saw them one afternoon pan out one panful of dirt in which there was between five and six dollars in g. l. d., and another with about one dollar. There are about 100 Chinamen placer-mining in American canyon; they are taking out plenty of gold. In Spring valley there are about 12 Chinamen working with pan and rocker. J. B. Foltz has his hydraulic works running at full blast; he works day and night, two eight-hour shifts; has plenty of water; he employs about eight men; has commenced at the lower end of the canyon and is working up; has good paying ground enough to last him 15 or 20 years. J. M. Terry has a gold quartz ledge in Spring valley and is running an arrastre steadily crushing the rock, and gets good returns. Robert Pfleger is still working on his mine at Sanborn; it has a good showing. James Hendra has a few men at work on his gold mine at Dun Glen and they are taking out considerable ore. Captain James intends to start up his five-stamp mill as soon as the weather will permit and the ground dries off enough to enable him to haul quartz and sagebrush to the mill. There are about 75 Chinamen working in Rockhill canyon at placer mining, and I am told they are taking out some fine nuggets.

THE CARSON DREDGER.—Virginia Enterprise, May 12: J. H. Rae, Manager of the Carson River Dredging Company, was on the Comstock yesterday afternoon. He reports good progress, and definite returns would now be making toward sulphuret and bullion returns were it not for a change being made in the main pump. The hydraulic affair had to be abandoned as not sufficiently efficient, but he has no doubt but that the new centrifugal pump now being adopted and placed in working position will bring about the desired success.

ARIZONA.

GOLD-MINING PROSPECTS.—Phoenix Herald, May 12: The Maricopa Gold and Silver Extraction Co. of this city seem to have an immense amount of test work to do. The mining men of the Territory are turning their attention to gold-prospecting this season, and, judging from the samples of ore that are coming in almost every day, Arizona is full of the precious metal. Hardly a day passes but what one or more samples of ore come in from some part of the Territory. A great majority of the ore, when assayed, shows it to be of average richness, and a good deal of it is exceptionally rich. The fact that gold-mining is again being revived and taken hold of so earnestly by miners, indicates one of the most prosperous years in that line that this section of country has known for years. Every portion of the Territory is receiving its share of attention from the prospector, and good reports are received on every hand. Again, capital is coming in to develop mining properties more eagerly and rapidly than before in some time. This shows increased confidence in Arizona's mines. Millions of Eastern dollars will be put in this year to develop Arizona mining property, and the result will bring Arizona before the country as one of the richest mining sections in the United States. The prospects were never better, and Arizona may well feel proud of the season of prosperity that is just dawning.

PRESIDENT NOTES.—Courier, May 13: A teamster team returned from Garland siding, where it took a carload of rich concentrates for Jack Lawler, from which point they will be shipped to Denver. Another bar of bullion has been brought in from the Quartz Mountain camp. The mill is running steadily, and Supt. Taylor has about 30 men at work in the mine. J. D. Helm and J. W. Cover of Foy mine, Tip Top district, report a good deal of chloriding going on; report a shipment of ore at Antelope, from Jesse Robeson's mine in the Black Canyon country, awaiting shipment to the Big Bug smelter. John S. Jones loaded two teams with lumber and the balance of the 60-foot smoke stack for his Chapparral Gulch quartz mill, yesterday. He will send out several more teams on Thursday. The boiler is now being put in place and he expects to be running by steam by the first of June.

KINGMAN.—Mohave Co. Miner, May 14: Gold properties in Mohave county are being eagerly sought after by outside capital. The gold strike of Russell, Zeimer & Co., below town, is showing up better and better every day. The shaft is now down 30 feet and shows up ore freely speckled with gold. Work on the Arnold mine has been suspended, awaiting the arrival of timbers and other necessary supplies. As soon as possible, work will be resumed in earnest and the shaft sunk to a depth of three or four hundred feet. Manuel Martinez has nine men at work on the Diamond Joe mine and is taking out considerable good-grade silver ore. There is now on the dump, ready for shipment, 200 sacks of ore. The new mill at El Dorado canyon is now running on ore from the McGregor group of mines. John Quinlan is superintendent of the property. The mines are looking fine and will be put in good shape the coming summer. The Plattsburg mine of Hyde and Hutt, in the Chemehueva mountains, is steadily producing high-grade ore. There is now on the dump about 20 tons of ore, ranging in value from \$250 to \$500, besides a large quantity of ore of a lower grade. The ore is being assorted with a view of getting only the high grade for shipment. Wm. Ridenour, while doing a little work on his copper property north of Peach Springs, opened up the vein to a somewhat greater depth than it had been before worked. His labors were rewarded by having his vein of ore change into a four-foot lead of solid copper glance, running 70 per cent copper and 23

ounces silver. The ore is the most beautiful, as well as the richest, copper ore we have ever seen in the county. We learn that the property has been bonded to Eastern parties for something over \$100,000.

CAVE CREEK ONYX.—Phoenix Gazette, May 12: Geo. H. Reynolds arrived yesterday from St. Louis to look after his mining interests. He has made arrangements to increase the working force at the Cave Creek onyx mines, and instead of shipping one carload of stone a week, the amount will be increased to three carloads a week for the present, with a chance of making it a car a day within a short time. Mr. Reynolds finds great demand for this onyx, and he will find it difficult to furnish enough until he gets his arrangements completed for handling it, and gets the mine opened up in better shape. The principal market will be in New York, though many tons of this valuable stone will find its way to other Eastern cities.

LOWER CALIFORNIA.

THE IRON INDUSTRY.—Ensenada Californian, May 6: The steamer Carlos Pacheco on her next trip from San Quintin will stop at San Isidro and bring up to San Diego 20 tons of the celebrated Tepustete iron ore. The ore is to be shipped by fast freight eastward and to England. It is understood that the English syndicate which has contracted for a large interest in the mine from Gen. Webb, received such remarkable results from recent treatment of the ore that it is now preparing the treatment on a large scale in their English furnaces for the use of their contemplated works on this bay. The ore has proved to be what is called Bessemer, and can be run at once into steel. It is said that the steel for the company's proposed furnaces at San Diego has already been accepted by the engineer. The Union is in possession of further facts in the case, but prefers to let the company's work speak for itself, which it will do very soon. There appears to be ample financial and business backing to the present undertaking.

OREGON.

ENGLISH CAPITALISTS.—Salem Statesman, May 10: At a meeting of the stockholders of the Gold Mountain & Dry Gulch Consolidated G. & S. Mining Co., called for that purpose yesterday afternoon, the directors were clothed with power to dispose of the mining property of that company located in the Santiam country. The company is now negotiating with a syndicate of English capitalists for the purchase of the mines, which are in the Quartzville district. The English capitalists say they will put a \$75,000 stamp mill in Dry Gulch if the property proves to be as represented after they have thoroughly prospected it. They say they will take up all of the stock and give the directors \$50,000 stock in the new company when the property is turned over to them. It is their purpose to have the mine inspected, and it is understood this will be done soon. If the prospects are good, it begins to look as if there would very soon be great activity in the mines of the Santiam.

JACKSON CO.—Jacksonville Democrat, May 13: Scott & Short are working a very promising ledge in Sterlingville precinct. The quartz is not abundant so far, but very rich. Houck & Co.'s new quartz mill last week arrived at Gold Hill and will soon be ready for crushing ore. It is a valuable addition to the mining interests of this section. DeBar & Co. are making excellent progress in developing their mine in Willow Springs precinct. They are down quite a distance, and the ledge is improving both in size and richness. J. W. Sherer & Co. of Galice creek are taking out \$100 per day with two men and a giant. Their mining property on Grave creek, covered by a five-mile ditch, is said to be even better than their Yank ledge diggings. E. Lister of Grant's Pass has bought the interest of Edward Keislin in the Anderson mine in the Applegate district for the sum of \$800. Work of development will be continued as fast as possible. Quartz from this ledge has been crushed in an arrastre for some time past with good results.

SOUTH DAKOTA.

BEAR GULCH TIN.—Deadwood Pioneer, May 11: The probabilities are that the present season will see an extensive tin reduction plant erected at Bear Gulch and the extension of the B. & M. Railroad to that region. Dr. Scott, who has been spending the past few weeks in this city, ostensibly to study law, but in reality to find some method for a profitable investment for the funds of a wealthy Philadelphia syndicate which he represents, recently paid a visit to Bear Gulch in company with W. H. H. Bowers, the representative of the Colorado Iron Works. While there, a thorough inspection of the tin mines was made and samples brought back to Deadwood. A series of experiments was made by Dr. Scott, and with the use of a new flux he was able to reduce the tin stone very cheaply. As a result, he ran out an eight-pound bar of tin. Some of the rock he brought back was very rich, running as high as 20 per cent metallic tin. He is of the opinion that tin in paying quantities exists in Bear Gulch sufficient to supply the world, and he will probably take hold of the matter with a view of properly developing it.

NEW MEXICO.

NOT ENOUGH COAL.—Southwest Sentinel, May 3: R. A. F. Penrose, Jr., and D. M. Barringer, the Philadelphia mining experts, who have been here for several weeks, have returned to Philadelphia. They looked over the Territory pretty thoroughly for coal and went to the much talked of fields between the Mogollons and Gallup, but found that there was not coal enough there to make coal mining profitable.

MECHANICAL PROGRESS.

Coke Oven Progress.

At the meeting of the Society of German Ironmasters held in Dusseldorf not long since, Herr F. W. Lurmann, of Osnabrück, read a paper on "Coke Oven Progress, with Special Regard to Obtaining By-products," of which the following is a summary: For obtaining by-products in coke oven working, which began some 35 years ago and at first met with little acceptance, the Hoffmann-Otto oven takes first rank, there being at present in Germany 1205 of these ovens. The installation of a group of 60 ovens costs 300,000 marks (£15,000), the necessary condensation apparatus 420,000 marks (£21,000). Such a group treats in the course of a year from 57,000 to 70,000 tons of coal with an average result of from 65 to 77 per cent of coke, 2.5 to 4.5 per cent of tar, and 0.8 to 1.25 per cent of sulphate of ammonia. The Semet-Solvay oven, the construction of which permits of a stronger formation of the covering masonry, attains a very high temperature, and good coke can be obtained with an addition of from 23 to 27 per cent of thin coal. From the same cause the yield is greater than, for example, that of the Coppee oven, which, however, is also a satisfactory oven, 1000 being in use in Great Britain. For some three years benzene has been obtained direct from the coking gases; the necessary apparatus, invented by Herr Franz Bruck, is a secret; it costs 5000 marks (£250) per oven. From 3 to 7 kilogrammes of benzene are obtained from 1 ton of coal. The value of the by-products amounts, for a Hoffmann-Otto oven irrespective of benzene, to from 3400 to 5000 marks, the average being 4600 marks (£230); for all the ovens of this system in Germany, 5,600,000 marks (£280,000). The old idea that in obtaining by-products the quality of the coke is prejudiced no longer, appear to hold good. In the discussion which followed, Herr Hussener mentioned that a certain water contents, according to the quality of the coal, from 10 to 17 per cent, is advantageous in coking, and that cokes poor in gas are not suitable for obtaining by-products; the limit is about from 80 to 82 per cent coke yield in the crucible.

COLORING BRASS.—A cold method of coloring brass a deep blue is as follows, according to the *American Manufacturer*: 100 grammes of carbonate of copper and 750 grammes of ammonia are introduced in a decanter, well corked, and shaken until dissolution is effected. There are then added 150 cubic centimeters of distilled water. The mixture is shaken once more, shortly after which it is ready for use. The liquid should be kept in a cool place, in firmly closed bottles or in glass vessels, with a large opening, the edges of which have been subjected to emery friction and covered by plates of greased glass. When the liquid has lost its strength, it can be recuperated by the addition of a little ammonia. The articles to be colored should be perfectly clean; especial care should be taken to clear them of all trace of grease. They are then suspended by a brass wire in the liquid, in which they are entirely immersed, and a to and fro movement is communicated to them. After the expiration of two or three minutes they are taken from the bath, washed in clean water, and dried in sawdust. It is necessary that the operation be conducted with as little exposure to the air as possible. Handsome shades are only obtained in the case of brass and tombac—that is to say, copper and zinc alloys. The bath cannot be utilized for coloring bronze, copper-tin, argentine and other metallic alloys.

LOCOMOTIVE MILEAGE.—That English locomotives sometimes make very large mileage, both per year and in total, is shown by the record of the "Charles Dickens," on the London & Northwestern Ry., which has made the round trip daily between Manchester and London (with occasional exceptions for repairs) since 1882, and on Sept. 10, 1891, completed its millionth mile. This is perhaps, says *Engineering News*, truthfully declared to be "a feat without parallel in the annals of railway traveling," as few engines complete their millionth mile, and fewer still do it in nine years, or at the rate of 111,000 miles per year. On the Pennsylvania Railroad, in 1885, the highest mileage which any passenger locomotive then had to its credit was 780,182 miles. Several had about 500,000 miles to their credit for ten years' service, and one had 41,510 miles for three months' work, or at the rate of 166,040 miles per year. The average of all passenger engines that year, however, was 45,936 miles (highest, 79,258), which is quite be-

yond any English precedent, and as several of the Western roads are far exceeding Eastern precedents in respect to locomotive mileage, it may be that some Western road has a locomotive in its service which has made a million miles in ten years. The New York Central has not, and it is likely to remain a very exceptional performance either in England or America until operating conditions have radically changed.

BELTS.—There is a natural law relating to belting, says London *Machinery*, which is not generally known, but which is nevertheless of value in practice. The hug or adhesion of a belt is as the square of the number of degrees which it covers on the pulley. For example, a belt that covers two thirds of the circumference of a pulley requires four times the power to make it slip as it does when it covers only one-third of the same pulley. When first put on, belts are always made tighter than they need be for the work required, in order to allow for the stretching which is sure to follow. They are then run until they become too loose for efficient service, and the process of overstraining and stretching is repeated. When vertical, this stretching of the belt acts directly to loosen it, and the necessity for tightening occurs more frequently than it does on horizontal belts, where the weight between the pulleys maintains more or less tension in the slack side. For this reason a long horizontal belt can hardly be made to slip, without working it to destruction, while the driving power of a vertical belt depends directly upon its initial tension, and this must be carefully looked after to obtain the best results. The position in which a belt may run does not affect the size required for any given duty, but it does affect very seriously the amount of care and attention required to keep it in efficient service.

PROGRESSIVE CATALOGUES.—The assistant librarian of the San Francisco Free Public Library has invented what he calls the "progressive catalogues." The idea is as simple as it is ingenious. It consists of a wooden box about four feet high, with a glass lid. Underneath the lid in the center of the box revolves a hexagonal roller made of wood. A number of thin wooden leaves, on which slips containing the names of books are fastened, lie piled one on top of the other at the bottom of the box. These are hinged together and the end one being laid upon the roller and secured by pins, and the roller turned by means of a handle outside the box, the leaves pass over the roller one after the other. The handle can be turned either way, as each leaf falls securely into its place upon pins ready to receive it, afterward dropping off the roller on the other side. The principle is that of a harrel organ. The machine will save a great deal of trouble in cataloguing, as there are no less than twelve alphabets in use at the present time. Any number of leaves can be inserted, and as these leaves are very thin the capacity of the machine is enormous. The machine was examined by the board of trustees, which adopted a resolution that the librarian should be permitted to try the invention during the present month, doing his work thereby in place of by manuscript.

LEAD-COVERED CONDUCTORS.—The substitution of lead instead of zinc for coating or galvanizing conductors is advocated in an article in *L'Electricien*. Zinc has certain disadvantages—tendency to form an alloy, high melting temperature and tendency to flake. Lead seems to be preferable for certain reasons, and its application is similar to that of zinc. The objects are cleaned electrically, and immersed in an aqueous solution containing 10 per cent of hydrochloric acid and one per cent of hydrofluoric acid, heated to 50° C. in a vessel coated with lead. They are connected to one pole of a dynamo as anode, the lead coating constituting the other pole. After this preparation they are dipped into limewater of the same temperature, and then into an alloy of equal parts of zinc and tin in hydrochloric acid, which greatly favors the adherence of the melted lead into which they are then dipped. The process is economical and is not confined to its advantage to iron or steel articles, but may be used for chemical and electrolytic vessels. The iron or steel wires serving as protection in armored cables, it is suggested, might be advantageously treated by this method in preference to the ordinary galvanizing process.

MR. JOHN RITCHIE, in a paper before the Scotch Society of Arts, dwelt strongly upon the fact that the electric motor is a highly efficient machine, and is much better adapted and more economical than steam for hoisting purposes.

SCIENTIFIC PROGRESS.

The Electrical Production of Ozone.

Dr. O. Frolich, of Dresden, after mentioning various laboratory experiments for the purpose, describes the plant as manufactured by Messrs. Siemens and Halske for the production of ozone on a commercial scale. The apparatus in which the discharge takes place is built up of an inner metal tube, kept cool by water, and forming the inner coating; this is surrounded by a celluloid or ebonite tube, and through the annular space between these two a continuous flow of oxygen is kept up. The outer surface of the celluloid tube has a metallic sheath which acts as the outer covering, and between which and the inner metallic tube a constant silent discharge is kept up. Ten such tubes are fixed together in a frame and joined up in parallel, both electrically and with regard to gas and water supply. An open circuit transformer is used, excited by a set of accumulators which also drive a small motor, by the spindle of which a make-and-break in the primary circuit is worked. The rapidity of make-and-break should be high, say 600 per second.

The sharper the variations in the secondary circuit the greater the production of ozone, and for a few tubes the interrupted direct current gives much sharper variations than an ordinary sine curve alternating one. When many tubes are used, however, their increased capacity affects the former and rounds its wave down to a considerable extent, while it does not appreciably affect the alternating current, which is, therefore, to be preferred when very many tubes are used. There appears to be a certain number of alternations which gives a maximum of ozone. The production also increases up to a certain point with the rate of the passage of gas through the tubes, but beyond this point increasing the gas has no effect.

The amount of energy expended in the actual formation of ozone is extremely small. It makes very little difference in the total work done if the space between the tubes be filled with gas, water or highly rarefied air. A 2-horse power apparatus produces about 2.4 milligrammes of ozone per second. It would greatly increase its usefulness if ozonized air could be compressed like oxygen, but this presents difficulties, as special pumps must be used. So far, the author has not got beyond nine atmospheres. Various uses of ozone are mentioned, such as disinfecting ships and buildings, destroying insects and sterilizing water, treating sewage, and also for brewing purposes.—*Am. Gas Light Journal*.

RAINFALL RECORDS.—In the annual report for 1892 of the Berlin branch of the German Meteorological Society, Professor G. Hellmann gives an account of his continued experiments, which are summarized in *Nature*, on the effects of exposure on rainfall records, and on the determination of the distance apart that rain gauges should be erected in order to obtain an accurate account of the rainfall of any district. Simple as the question appears, the experiments, which have been carried on for seven years, have not sufficed to give a definite answer. Very considerable differences are found in the amounts recorded at stations comparatively close to each other. This result is partly owing to the effect of wind, especially in the case of snow. The following are the most important conclusions derived from the experiments: (1) The more a rain gauge is exposed to the wind, under otherwise similar circumstances, the less rainfall it records, and the higher a gauge is placed above the ground, the less rain it catches, as the disturbing influence of the wind is greater than on the surface of the ground. But if protected from the wind, a gauge will give useful results in an elevated position. The usual instructions to erect the gauge as openly as possible are therefore incorrect. (2) Even in a flat country, differences of five per cent occur in different months, at stations a quarter of a mile apart; in stormy weather, especially during thunderstorms, the difference may amount to 100 per cent. The amounts recorded at neighboring stations agree better together in spring and autumn, and also in relative wet years. Further experiments are needed, if possible by means of anemometers erected at the same level as the rain gauges, to determine more accurately the effect of wind on both rainfall and snow.

FLARED COAL TAR FOR WATERPROOFING.—According to the *Revue des Travaux Publics*, the use of coal tar as a means of rendering masonry impervious to water is much favored in France. There are two ways of preparing the tar for this use—boiling and flaring. The former method is suit-

able for surfaces intended to be exposed to the atmosphere, while the latter is appropriate for surfaces to be covered up by masonry, earth, etc. By adding to the coal tar a paste made by dissolving Iodine rubber clippings in benzene, a coating may be obtained which is still more resistant, elastic and durable. For roofs, the heat-absorbing quality of the black varnishes may be overcome by dusting them with any permanent white earth before they are quite dry. For masonry to be covered up, the use of flared tar is highly recommended. This is prepared by boiling the tar in a caldron, and filling a bucket two-thirds full from it. The tar is then lighted at the surface and allowed to blaze 15 or 20 minutes, being constantly stirred the while with an iron rod. When a drop from the blazing bucket upon cold stone has the consistency of thick soup, the flare is extinguished by covering down the bucket with an iron lid. The tar will then be reduced to one-third its original bulk, and it must be spread as rapidly as possible upon the work with a cod-tail brush of vegetable fiber—care being taken to dip often, so as to prevent its cooling and hardening prematurely. If the flaring process is prolonged beyond the proper moment the result is a brittle product like sealing wax. When the flare is stopped at the right time, the resultant tar adheres very firmly to any surface, and can be immediately covered up with earth. It has a skin both hard and tough, underneath which is a viscous layer about 1-25th of an inch thick, which preserves its integrity for any length of time.

A NEW ETCHING PROCESS.—A new process of attacking metals by means of acids, by which intricate and beautiful designs can be produced, has been introduced by Wm. Hyland of New Haven, Conn., says *Iron Age*. It is a common method of ornamenting metal to apply to the surface a coating in such a way as to leave exposed the surface of the metal which it is desired shall be acted upon by acids or by the electroplating process. The coating ordinarily employed when the metal is placed in what is generally called "ormolu dip," which is a very strong and hot acid bath. The essence of this new process is found in the coating employed, the acid-resisting properties of which are such that, after the metal has been coated, it is simply placed in the bath and allowed to remain there until the desired effect is produced, which is a granulated or what is termed a satin or ormolu finish. The surface coated, of course, retains the natural finish of the metal. It is evident that the process can be employed so as to produce a natural surface on a treated ground, or the reverse. With the process, designs of the most elaborate description can be obtained.

ELASTIC VEGETABLE MATERIAL.—A peculiar vegetable material has recently been imported into this country from Oran, an Algerian port on the Mediterranean sea, which is said to possess the quality of being so elastic that it can be used as a substitute for springs and the like in the manufacture of furniture backs and seats. This material is so expansive, and so easily affected by high temperatures in its dry state, that when packed the bales have to be held in place by means of heavy steel bands. The peculiarity of this grass is that it thrives only around the volcanic slopes of Oran, and flourishes up to within a short distance of the craters themselves, the latter being always in a semiactive state, and the earth around so warm that not a plant of any kind can thrive or is ever seen to grow, except this steel-like product.

CONSIDERING some of the claims that are being made now, it may be well to recall the fact, says the London *Engineer*, that during the electrical exhibition of Turin, Italy, in 1884, there was in operation a transmission of power from that city to the city of Lanzo, a distance of 10 kilometers—6¼ miles. The wire was four millimeters in diameter, or about No. 6, B. and S. gauge. The alternate current dynamo generated 10,000 volts. At Lanzo the power was used to run 60 incandescent lamps of 16 candle power and one arc lamp. At Lanzo there were four transformers of the Gaulard and Gibbs type, in addition to a special one for the arc lamp. On the 25th of September, in the presence of the international jury, it was found that the efficiency was 89 per cent. Messrs. Gaulard and Gibbs were awarded the grand prize of 10,000 francs by the Italian Government.

ALUMINIUM has been found to be unsuitable for vessels intended to hold preserved foods, as these articles have commonly to be heated in order to sterilize their contents, this treatment injuring the metal.

ELECTRICITY.

Quartz Fibres for Suspension Purposes.

In the electrical laboratory of Queen & Co., Philadelphia, a series of interesting experiments have recently been made upon the properties of quartz fibres for use in suspending galvanometer systems, and in other physical measurements, as compared with fibres of glass, metal and cocoon silk. These tests have resulted so much in favor of the quartz fibres that that firm has decided to prepare them for sale.

These fibres, says the *Electrical World*, are drawn in the oxyhydrogen flame from pure rock quartz, their diameter being regulated by the speed of drawing. As to size, it is possible to draw them from those too fine to manipulate (less than $\frac{1}{1000}$ inch) up to rods $\frac{1}{16}$ inch in diameter, and in lengths (for diameters less than $\frac{1}{1000}$ inch) to $\frac{1}{16}$ inch, as desired. Inspection with a microscope shows that they are extremely uniform in diameter and contain no "fishes" or flaws of any kind.

Some of the advantages possessed by quartz fibres over others are, first, perfect elasticity; they show absolutely no "Nachwirkung" or "set," and, when twisted, come back to the same position immediately. It is thus possible to reach a much higher degree of sensibility with a galvanometer using a quartz fibre in place of unspun silk, for, as is well known, a cocoon fibre, to which is attached a system under small controlling force, will not return at once to the zero point within 5 per cent of the total deflection. Quartz fibres are also unaffected by ordinary changes of temperature or atmospheric conditions, whereas silk fibres, absorbing greater or less amounts of moisture at different times, will have correspondingly different zero points.

The tensile strength of the quartz fibre is from 50 to 70 tons per square inch, which is nearly as great as the best steel and many times that of silk. Fibres of extreme fineness may, consequently, be used, as, for example, a quartz suspension $\frac{1}{1000}$ inch in diameter will sustain a weight of one-half gramme. They are, however, very easily broken by lateral stress, and they are, therefore, raised or lowered as a whole instead of attempting to bend them around a spindle, although the finer ones can be successfully wound upon spindles of a diameter of one-half inch or greater.

The uses of quartz fibres are various. They can be employed advantageously for all electrometer and galvanometer suspensions, and, as suggested by Mr. Boys, may be used to suspend very small bodies, the specific gravities of which are required, as there is practically no capillary attraction between the fibre and water. Being unaffected by heat and of a very uniform diameter, they are excellent for use as cross-hairs in telescopes and microscopes; in fact, they can be used to advantage for any of the purposes for which fibres of other material are now employed, and they bid fair, on account of their many excellent qualities, to displace their older rivals.

TRAINS BY ELECTRICITY.—The *Western Electrician* says that attention has been repeatedly directed to the fact that the present prosperous condition of the electrical business is due in a large measure to the bold and confident policy of manufacturers in championing their systems, and now comes the news from Baltimore, Md., of what to the general public will seem to be one of the boldest propositions yet advanced. A prominent electric railway company has offered to equip the tunnel of the Belt Railroad Company for the running of trains by electricity without the expenditure of a dollar on the part of the Belt Company. The proposition has been accepted, and the electric company agrees to give the railroad the free use of the plant for six months, provided, of course, that if the enterprise proves successful it will be accepted and paid for. While there is not the least doubt but that the electric company will surprise the railway people and show them what electricity can do, one cannot fail to admire this example of that enterprise which has been characteristic of the more successful of our electrical exploiters. In this instance, as has been the case before with a number of other concerns, we find the electrical people shouldering absolutely the entire responsibility of the project, while the railroad company very generously and magnanimously agrees to witness what it doubtless believes in heart to be an experiment. Now that so many rapid transit underground schemes are projected, a demonstration like that which will be made in the Baltimore tunnel will have a most salutary effect in convincing the doubting minds that the one motor for tunnel service is the electric.

THE EFFICIENCY OF THE LAUFFEN-FRANKFORT TRANSMISSION.—The president of the Frankfort Exhibition, Mr. Sonnemann, has made the following announcement as to the efficiency of transmission of the polyphase system between Frankfort and Lauffen: "Official report of testing committee gives mean efficiency in Frankfort at full load 74 per cent, where loss of energy in dynamo, 8 to 10 per cent, included; from this results for transmission proper to secondary transformer at the exhibition a mean efficiency of from 80 to 82 per cent." It is gratifying to note that the minute investigations of the testing committee bear out the statement of the *Times* correspondent, who, from his personal investigations, gave the efficiency as not less than 75 per cent. "The result obtained in the Lauffen-Frankfort experiment," adds Dr. Maier, "is magnificent. It surpasses even the most sanguine expectations and removes any doubt, if doubt still existed, as to the practical feasibility of electric power transmission over a long distance. It is impossible to foresee the far-reaching consequences of this experiment; it is destined to revolutionize all our industrial methods and to lead to a general utilization of natural forces now running to waste."

RECENT PROGRESS IN ELECTRICAL INDUSTRIES.—It may seem almost superfluous to give figures to substantiate the statements that have been made about the almost abnormal growth of the electrical industries; but for the benefit of the skeptical, as well as for others interested in the actual figures, the *Electric World* has compiled the following, which fully substantiates the claims made regarding this growth. From the reports of the various Secretaries of State, it appears that in the last eight months 284 new central lighting stations were incorporated, representing a capital of \$100,192,900; 133 new general electric trades, representing a capital of \$67,946,500, and 105 new street railways, representing a capital of \$61,100,300, not all of which, however, were electrical, although we have no doubt it will be found from detailed reports that by far the larger part of them were, as it is difficult to conceive that at the present time anything but electric and cable roads would be projected. The grand total of all these for the past eight months is \$229,239,700.

OIL INSULATORS.—The oil insulators, which worked so well in the Lauffen-Frankfort experiment, and to which so much of its success has been attributed, seem not to be working so well between Lauffen and Heilbrunn, as they have all been abandoned on the high pressure part of that line. That installation is a permanent one, transmitting about 600 horse power from Lauffen to the cement works at Heilbrunn about six miles away. A 50 volt Drehstrom current is transformed up to 5000 volts for transmission, and then transformed down again for use, first to 1500 and then to 100 volts. The reasons for this failure of the oil insulators at such a comparatively low pressure, when they had successfully withstood over five times as great, does not appear, as Herr Meissner, the engineer of the undertaking who stated the fact before the Elektrotechnische Verein at Frankfort, recently declined to answer questions as regards the cause. Electricity.

IT IS NOT ALWAYS THUS.—An interesting and amusing instance of the efficacy of the London-Paris telephone occurred the other day which is worth recording. The Salvation Army band were marching from the Royal Exchange, London, playing the "Marseillaise," when an idea struck the men present in the telephone room. The windows and doors were thrown open, and the attendant at the Paris end was asked if he could hear anything. The response (in French) was immediate, "Yes, I can hear a band playing the 'Marseillaise.'" That a band of music playing in the streets of London could be plainly distinguished in Paris is, we think, a sufficiently striking marvel of nineteenth century science.

AN ELECTRIC PLANT.—The Alaska Mining Company, whose property is located at Pike City, Sierra county, is making arrangements to put up an electric plant to do the pumping and hoisting. It is intended to obtain the water power from the Middle Yuba river, with which to drive the dynamos by the use of Pelton wheels. Some years ago the Alaska was a large gold producer, but there was such a heavy body of water to contend with that the cost of keeping it under control was enormous, and the company finally gave up the contest. By the use of electric power it is estimated that the cost of pumping will be greatly reduced, and that the mine can again be placed on a profitable working basis.

GOOD HEALTH.

Organisms in Surface Water.

Thos. N. Drowne, in a report to the Board of Health of Newport, has the following to say on this subject: "The excessive development of vegetable organisms in surface water, with all its attendant evils, may be briefly explained by the statement that there is abundant food to support these organisms. In all surface waters these vegetable growths are found to a greater or less degree, and the reason why some bodies of water have few and some have many is that the former contain but little food for their support and the latter contain much. The analogy between poor crops on a barren, rocky soil and an abundant harvest on good soil, richly manured, is one that may serve our purpose by way of illustration.

A good deal of information on this subject has been acquired by the recent investigations conducted by the State Board of Health of Massachusetts. Some of the conclusions that have been arrived at in the course of these investigations are as follows:

1. Polluted waters of ponds and reservoirs, that is to say, water that receives readily decomposable organic matter, such as sewage or the drainage from houses, stables, manured fields and the like, is more liable to give trouble from vegetable growths than that which is free from such pollution.
2. Artificial storage reservoirs, which have not been cleaned before flooding, by the removal of all trees, shrubs, and rich surface soil, supply, by the decomposition of this vegetable matter, the conditions for an abundant development of organisms.
3. Shallow ponds and reservoirs, and those with much shallow flowage, are more liable to give trouble than deep ponds and reservoirs.
4. The larger amount of decomposable organic matter present in the water, the greater the probability of the development of blue-green algae, which are highly nitrogenous, and give on decomposition the characteristic pig-pen odor.

SHADE TREES ON CITY STREETS.—Shade trees on city streets have been condemned by sanitarians as inducing dampness and shutting off air and sunlight. While this is perfectly right under the conditions frequently afflicting us, says G. N. Bell in the *Sanitarian*, other conditions may be promoted that render tree-planting on our residence streets both advantageous and pleasing. Assume an average city street 60 feet in width and running due north and south. On each side of the roadway there will be a footway of 12 feet. Let us pave but seven feet of this. The depth of the lot, we will say, is 125 feet. Allowing 65 feet for the depth of the house, there will be 60 feet depth of yard room. Thirty-five feet in the rear ought to afford ample drying room, and we can then set our house 25 feet back from the street. From the front of the house, then, to the curbstone there will be 37 feet. Midway between the edge of the paved sidewalk and the curbstone affords a line for the location of trees over 35 feet from the front of the house. Trees at this distance from the house obstruct no air nor sunshine detrimental to residents, and the cost of the trees is comparatively small in consideration of the increased value of the adjoining properties. On streets running east and west, trees are advantageous on the north side only.

CHARACTER AND EYES.—A far-searching individual, who has apparently made a very deep study of the pigmented cells of the iris, tells us that a person's character can often be best told by the color and depth of his eyes. People do not usually apply more than four or five colors to eyes, so that any that are not blue, or black, or brown, or hazel, are called gray. Yet there are a hundred different kind of gray eyes. You seldom see a stupid person with gray eyes, but the genuine gray is always found among highly intellectual people. Steel-gray eyes with large pupils denote intense feeling; blue-gray eyes are generally possessed by people with kindly hearts. You never find a mean spirit behind a pair of blue-gray eyes. Blue eyes denote quickness of thought, and generally fine physical development when they are large and bright. About nine-tenths of our engineers, lighthouse-keepers, policemen and army and navy officers, and many others selected for physical perfection, have blue eyes. Hazel eyes denote musical ability and grace of person; they are very pretty eyes, too. Our omniscient informant does not make it clear: Which is cause and which effect? Does individual character affect the color of the eye, or does the color of the eye affect the individual character?

USEFUL INFORMATION.

IMITATION FUR.—A recent invention of English origin is that of a looped fabric finished in such a manner as to imitate very closely the skins of bears, buffaloes, sables, foxes and other animals. In the process of making the material, the loops which constitute the pile are formed in different lengths. After the weaving of the fabric, the loops are drawn out by a revolving wire brush or card, and this process finishes the ends of the threads so as to make them finer at the points than at the roots. The pile is then formed at different lengths, consequently the resulting fur is thicker at the bottom than at the outside, thus most nearly resembling the real fur to be imitated. The fabrics made in this way are intended to be used as carriage rugs, door mats and for other purposes, the effect being, it is said, so good that the imitation cannot be detected except on close inspection.

DRILLING VS. PUNCHING IRON.—If the punch was boycotted in every carriage shop, this last means of getting rid of an objectionable article would contribute a little to the benefit of mankind. There was some excuse for using the punch before the days of twisted drills and improved drilling machines; now there is none, as the time necessary to drill through most irons that have to be punctured in a carriage shop is too slight to serve as an excuse for doing so much damage as is done when the punch is used. Driving the punch through a piece of iron weakens the fibers to a greater or less extent; it bulges when the metal is not very heavy outside of the holes. The drill on the contrary, cuts away the metal and leaves the iron around the holes intact.

TUNGSTEN has come prominently forward recently for use in alloying with steel, the resulting metal possessing great resisting power to heavy blows. The demand for wolfram, the principal ore from which the tungsten is obtained, has increased considerably, and as the supply is somewhat limited, the market price has risen to a higher figure than has been obtained for years. Recent experiments, says the *Manufacturers' Gazette*, tend to show that tungsten steel will come into extensive use in the manufacture of war material, probably taking the place of the nickel alloy.

R. G. CUPTELL, a prominent glass manufacturer, claims to have discovered the lost art of casting glass tubes, which is known to have been practiced by the Egyptians. He has interested capitalists in his invention, and has erected a factory at Pendleton, a small town near Anderson, Ind., and recently made his first cast with success. The glass tubes are suitable for sewer, gas and water mains, and are joined by a glass cement, also the invention of Mr. Cuptell. The factory is a large one and all operations are conducted with the greatest secrecy.

PRIMARY BATTERIES.—The *Manufacturers' Gazette* says: If some one would devise a primary battery which would meet the demand which the introduction of the electrical apparatus calls for, they would be sure of a fortune in a very short time. There is not a primary battery on the market to-day which gives anything like satisfactory results, the nearest approach to it being the old-fashioned gravity, or Daniels. There are many of them advertised, but few that come up to the claims made for them.

CONDENSATION HYGROMETERS.—A very interesting improvement in dew point hygrometers has been recently effected by Mons. Henri Gilbault. In order to fix with great precision the exact temperature of the condensing surface, he employs simply a sheet of glass coated with a thin layer of platinum. This platinum is the surface of condensation, and its temperature is indicated, within, it is stated, one-thirtieth of a degree, by a galvanometer which marks its electric conductivity.

ARTIFICIAL IVORY is now being manufactured from milk, by coagulating it as one would in making cheese, mixing the solid portion with borax, and subjecting the mass to high pressure. The resulting product, upon which the curious name of "lactis" has been bestowed, is said to be hard, durable and well suited for the manufacture of combs, billiard balls, penholders, pipe mouthpieces and so forth.

A NEW silver-plating process has been introduced in London in which the coating produced is only slightly tarnished by atmospheric influences, and is not easily affected with acids. The process is similar to the present methods except that a secret alloy is used.

TABLE OF CONTENTS.

EDITORIALS—The Sergeant Rock Drill; The Outlook for the Hydraulic Miners, 367. Increased Demand for the Gold Mines of California; And Silver—What of It? 374. Progress of Mining in China, 375.
 ILLUSTRATIONS—The Sergeant Rock Drill Working Close to a Wall, 367. Progress of Mining in China, 375.
 CORRESPONDENCE—The Cyanide Process; Heretical Geology, 368. The Cyanide Process, 376.
 MECHANICAL PROGRESS—Coke Oven Progress; Coloring Brass; Locomotive Mileage; Belts; Progressive Catalogues; Lead-Covered Conductors, 372.
 SCIENTIFIC PROGRESS—The Electrical Production of Ozone; Ralufall Records; Flared Coal Tar for Waterproofing; A New Etching Process; Elastic Vegetable Material, 372.
 ELECTRICITY—Quartz Fibers for Suspension Purposes; Trains by Electricity; The Efficiency of the Lauffen-Frankfurt Transmission; Recent Progress in Electrical Industries; Oil Insulators; It Is Not Always Thus; An Electric Plant, 373.
 GOOD HEALTH—Organisms in Surface Water; Shad Trees on City Streets; Character and Eyes, 373.
 USEFUL INFORMATION—Initiation Fur; Drilling vs. Punching Iron; Miscellaneous, 373.
 MINING SUMMARY.—From the Various Counties of California, Nevada, and other Pacific States and Territories, 370-371.
 MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 382.
 MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 382.
 MISCELLANEOUS—How Miners Can Get Fresh Water; A Mill at Sutor; Varieties and Uses of Mica; Shasta County Mines; Mining in Tonquin; The Banner Mine, 368. World's Fair Queries; The Canadian Mineral Act; Shipments of Quicksilver; An Unlucky Tunnel; Gas for Smelting; A Strike of Green Oil in Kern; A Good Move, 369. The Rolling of Vessels; California Onyx, 376. The First Foundry in Chicago; The Engineers' Visit, 379.

WHEN we have rehabilitated hydraulic mining, and it will be pouring, as aforesaid, its wealth into Marysville, restoring its prosperity and repeopling its waste places, then will our friend of the Farmer be in more amiable mood, and possibly cease his diatribes against the hydraulic miners altogether. Until then, this very able and otherwise estimable gentleman must be permitted to indulge his favorite pastime in peace.

THE number and the extreme fatality of the accidents occurring everywhere in the mines of late admonish to greater care on the part of those exposed to these dangers, both employers and workmen, many of these casualties being due to the carelessness or the imprudence of the latter.

THE BOOMING RIVERS.—The recent warm weather causing a rapid melting of the snow on the mountains, has caused a booming of the rivers, already pretty well filled by the heavy spring rains. The water supply, now ample for every use, will be likely to hold well into the summer.

MINING OPERATIONS are now being actively prosecuted along the main gold belt below the heavy snow line, the outlook being favorable for a good summer's work in our several gold mining fields.

OUTSIDE of California the resumption of mining operations has been somewhat delayed, owing to the past inclement winter, which, besides proving severe, has been unusually protracted.

Increased Demand for the Gold Mines of California,

But Sales Harder Than Ever to Effect.

The business of gold mining in California, everything considered, is in a more satisfactory condition at the present time than ever before, and that mainly because it is now being carried on more in conformity with the rules and requirements that govern the conduct of other leading industries. Owing to this fact and to the many improvements that have lately been made in the mechanisms and the metallurgy of the business, there is noticeable a growing disposition on the part of capitalists and others having money at their disposal to invest in this class of mines. This disposition is manifesting itself in various ways, chiefly in a greater inquiry for properties of this kind. The mine hunters and the mine viewers are abroad. They do not make themselves conspicuous on their travels, nor do they advertise their wants in the newspapers. Nevertheless there are scores of would-be investors and mining experts making a still hunt in California for gold-bearing deposits, both vein, hydraulic and drift.

Now, with such increased inquiry for our gold mines, it would naturally be inferred that sales of this class of properties could be effected more readily and with greater facility now than ever before; but such is not the case. Paradoxical as it may seem, the very reverse is true. Just in the proportion that the negotiator for a mine is anxious to get hold of it, he appears cautious and exacting. While such statement on the face of it looks absurd, it is nevertheless true, the explanation of such seeming contradiction being this:

Formerly, mines were, as a general rule, bought largely for speculative purposes—to be sold again at greatly advanced prices, or to be capitalized at enormous figures and the shares sold on the stock boards or peddled out to the credulous and easily gulled public. When, as in years past, this method of handling mines largely obtained, it mattered little to the buyer whether he paid a big or a small price for the property purchased, or whether, indeed, the latter possessed much or little value, inasmuch as it answered his purpose equally well, so the scheme was adroitly manipulated. And why should the buyer have higgled about the price of a mine or been particular about its merit, seeing these constituted then such unimportant factors of the transaction? And that he did not so higgled was to his credit as showing a willingness that the vender should participate, to some extent at least, in the benefits expected to be realized from the swindle.

At the present time these conditions are all changed; gold mines are not now being bought for stock jobbing or other illegitimate purpose. Buyers, at least in California, are for the most part seeking these properties as a permanent investment, their purpose being to hold and work them for the profit they may yield, the same as they would buy a stock ranch, a farm or a vineyard; but they know that mining is a more uncertain branch of business than either of these, and feel that they should, when about to engage in it, exercise a degree of caution proportioned to the uncertainties that attend it.

Not like the professional manipulator of stocks and promoter of sales do these men expect to derive revenues from cross deals, simulated sales in the stock boards, or other Peter Funk operations, but solely from the net earnings of the properties they purchase, and for which they exchange their hard-earned double eagles. They cannot, if they get pressed for funds, raise money by hypothecating stock, boosting the share market, or by recourse to other sharp proceeding. If short of cash, they must go down into their pockets for it, or borrow as best they can, until such time as the prod-

uct of their mine will suffice to relieve their financial stringency.

Because there has occurred an increased disposition to invest in our mines, let not the owners of these properties, or claim holders generally, beguile themselves into the belief that there is going to follow a boom in the business of selling mines. What has been said in this connection ought to prevent any notion of this kind from spreading abroad, and dispel the illusion if it have already obtained among the parties alluded to.

It will be observed that we do not allege that the gold mines in this State are being sold to a greater extent now than formerly; but simply that there is more attention being paid to this class of properties, and that with a view to buying and working them. As to effecting a sale, this, for the reasons mentioned, is more difficult now than ever before; nor is it at all probable that intending purchasers will hereafter relax anything of their vigilance or show themselves less exacting in their requirements, if, indeed, they do not become more critical and more guarded than heretofore.

As all this amounts to simply a manifestation of cold business sense, it is not to be deplored. Persisted in, it will ultimately work to the benefit of gold-mining, rescuing it from the hands of unprincipled adventurers, speculators and sharpers, and lifting it on a higher industrial plane than it has ever yet reached, or would be likely to do, if pursued in the slipshod, unbusinesslike manner that has heretofore marked its conduct.

And Silver—What of It?

It is singular that, for a matter of such far reaching and vital consequence, there can be found for the silver question no place in American politics—that is, party politics. As between the two leading parties in the country this cannot be made an issue for the reason that the adherents of these parties appear to be about equally divided for and against the free coinage of that metal, nor are they at all united as to what policy should be pursued in dealing with this difficult and vexatious problem; all of which illustrates how much easier it is to commit than correct an error, once we have fallen into one.

Prior to 1873, when silver was in this country being coined freely and circulating the same as gold, all went well. No complaints were heard, nor was any opposition made to this arrangement because there was no just grounds for any. For some unaccountable reason, unless, as seems probable, the movement was inspired by the creditor classes, the white metal was then demonetized by act of Congress. The passage of this law does not appear to have met with much resistance, either in or out of Congress, and that for the reason, no doubt, that its effect was not then foreseen or even apprehended. As a general thing it may be said that everybody acquiesced in it; certainly it met with no widely recognized or vigorous opposition.

In addition to the cause above alluded to, the greatly increased production of silver about that time may have had something to do with its demonetization. The Comstock mines had, ten years before, begun to turn out great quantities of silver, and were now threatening to largely increase their output. That this prospective increment of the white metal had something to do with its degradation may well be, the ostracizing of silver by England and Germany also tending to induce unfavorable legislation by our own Congress. Possibly, too, the financiers and the governors of the great fiscal institutions of the world, recalling how the discoveries of gold in California and Australia had tended to cheapen that metal, fearing a like result in the case of silver, determined on its dethronement before its purchasing power had been dangerously reduced.

Be that as it may, the baneful effects of this law began to make themselves manifest

soon after its enactment. Silver, before maintained on a parity with gold, began to depreciate, and, from that time till this, has constantly fluctuated in value, having not long since reached its minimum; the price being lower than ever before in the history of that metal. And so matters in this connection have been going from bad to worse until, at last, many of our large silver-producing companies have been forced to close their mines because of the depreciation of silver, this action having been induced hardly more by the present low price than the doubtful status of that metal in the future.

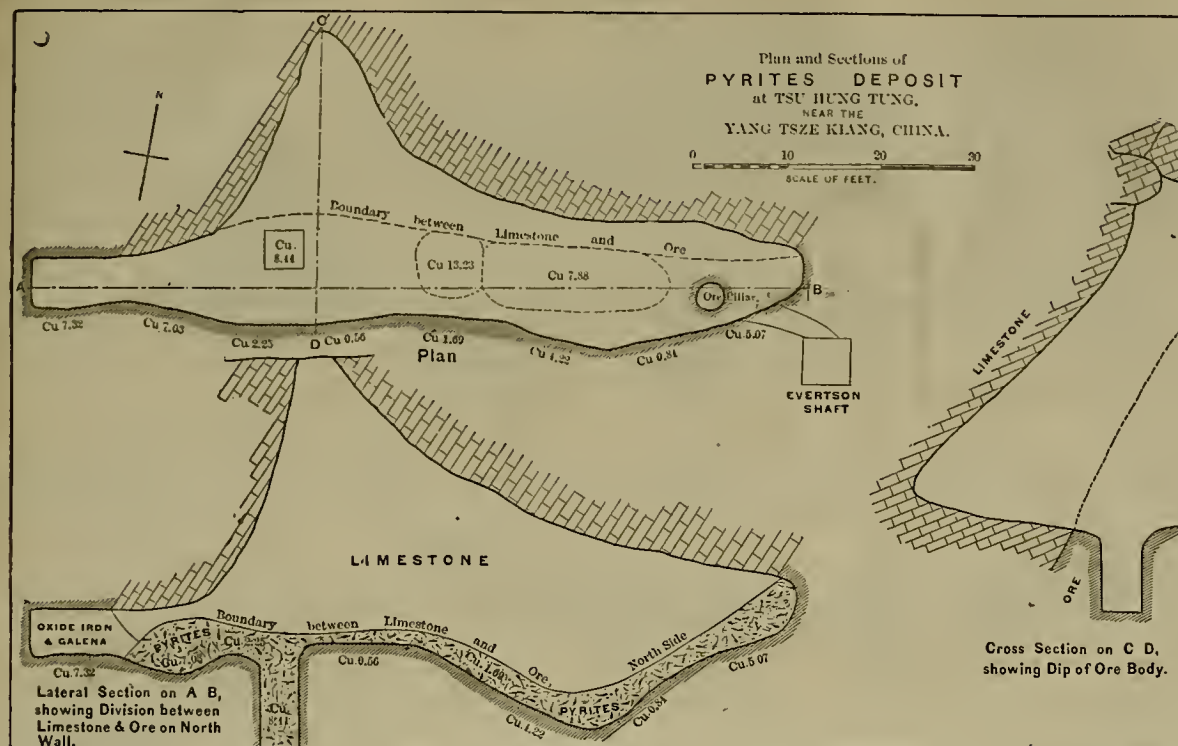

Such being the situation, it is pertinent, addressing our National Legislature, to ask, in the language of Boss Tweed, "What are you going to do about it?" We do not put this question to the members of that body in the expectation that they will be able to give us an intelligent answer, because clearly they don't know themselves what they are going to do, the situation being aggravated by the fact that we do not feel quite competent to advise them what they should or can do. This is a problem difficult of solution—a case in which doctors disagree, rendering it very dangerous for the patient.

One thing, however, may be said. The output of silver has not of late been increasing at anything like a perilous rate, nor is it likely to do so. The opponents of free coinage need have no apprehensions on that point. The increment of this metal has not, in fact, kept pace with that of the population, industries and general growth of the country. We need to enlarge our currency, and may safely proceed to do by the reinstatement of silver, there being no likelihood that it will ever reach undue proportions through overproduction. The annual coinage of the white metal does not reach one dollar per head of our population, nor will it, should we mint all the silver we ever produce, be likely to do so. Upon the whole, we think it would be safe and expedient to coin all the silver produced by our home mines, though possibly it might be good policy to induce other leading nations to come into an arrangement with us as to the relative value to be fixed upon for the two metals, before proceeding to do so.

TROUBLE AT COEUR D'ALENE.—For six months the mines of Coeur d'Alene, Idaho, have been closed on account of a strike of the carmen and shovelers, who wanted \$3.50 a day, the price paid to skilled miners. Both the Mine-owners' Association and the Miners' Union last month announced ultimatum, which were irreconcilable. May 1 was the date on which the time for arbitration ended. Now there are posted in all mining districts around Lake Michigan advertisements for miners for the Coeur d'Alene country. Two thousand are advertised for, but the Miners' Union, urged by the prospect of a perpetual freeze-out, have threatened to allow no nonunion man to work. Last week they drove two nonunion foremen out of the country. This week the Mine-owners' Association secured an injunction in the United States Court at Boise to prohibit the Miners' Union from offering interference. Fifty Deputy United States Marshals have gone to the mines.

THE CHICK PROCESS.—Should this paragraph meet the eye of any one having a knowledge of the so-called chick process, in use at Redding, Shasta county, several years ago, we would be glad for some information in regard to the same—what it consisted of, how operated, etc., as full a description of the process, in fact, as can be conveniently given.

THE visit of the editors to California has called away Mr. A. T. Dewey to assist in entertaining them. Therefore, his promised letter on the Sunset Oil Works must be deferred until another number of the PRESS.

Progress of Mining in China.

Within the last ten years, the progressive party in China has been making great efforts to develop the mining resources of the country—coal, gold, silver, copper and lead. In the Chi-Chao district, some 300 miles up the Yang Tze river, several deposits are worked, the principal of which is the Tsu-Hung-Tung pyrites deposit, the Nao-Lung-Ching hematite deposit, and the lead-zinc vein at Tung-Chi-Lung. Mr. Ellis Clark of Philadelphia read a paper before the American Institute of Mining Engineers, in which he described the mines being worked by the Chinese companies.

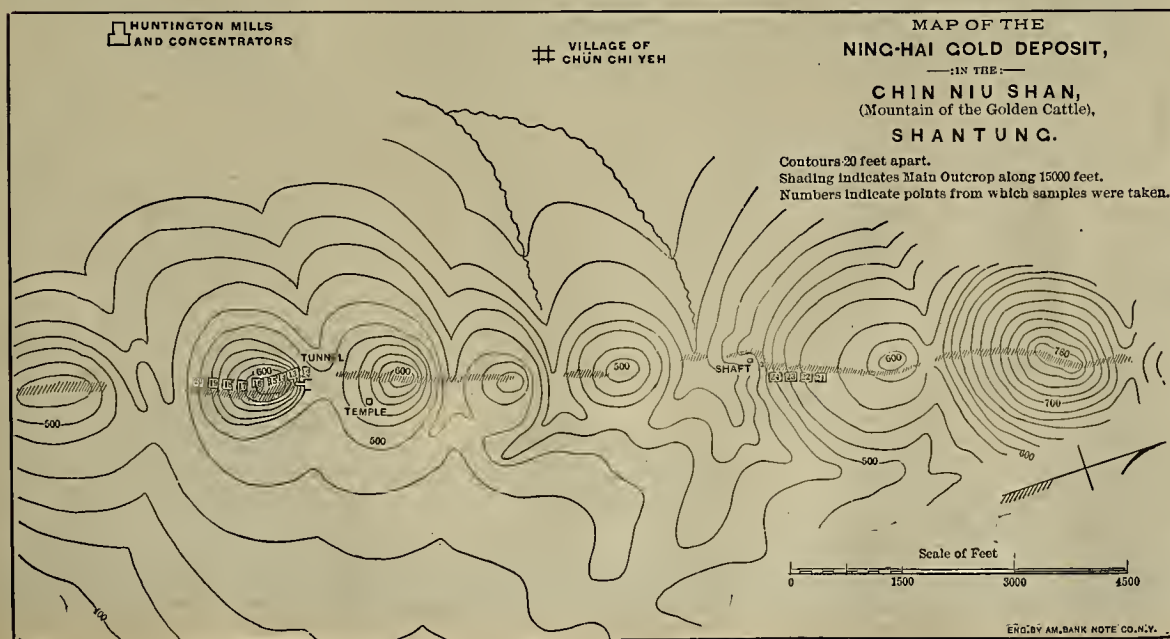

The first of the Tsu-Hung-Tung deposits (see figures) is the most interesting of the series, and consists of a lenticular deposit of copper and iron pyrites, oxide of iron and a little galena, developed to a length of 80 feet, a thickness of 5 to 12 feet, and a depth of 40 feet.

At the time of the writer's visit no copper in quantity had ever been made from the ore, the opening having been made years before for the purpose of distilling sulphur from the pyrites. Some ore was then shipped to the sulphuric acid works of Major Brothers, limited, at Shanghai, the acid works at Luo-Pao-Chi having ceased operations, but after an extended trial it was found that the ore contained too much arsenic for the profitable manufacture of sulphuric acid. The Evertson shaft, shown at the eastern end of the working, has been sunk under and parallel to the vein; it is 70 feet deep and terminates in a rich brown oxide of iron containing traces only of copper.

The iron deposit of Nao-Lung-Ching is about two miles northwest of Tsu-Hung-Tung. The ore consists of hematite which has been probably derived from pyrites, as specks of this material can be seen by careful inspection. The deposit has been opened by four superficial shafts at distances of 75 feet, and although the growth of weeds and creepers prevent the exact location of boundaries from being ascertained, it is probably 400 feet long, with a width of 30 feet. The sulphur in this ore will probably prevent its use for the manufacture of iron.

Tung-Chi-Lung.—The lead-zinc opening of the Tung-Chi-Lung is situated 27 miles southeast of Tsu-Hung-Tung. It consists of a heavily mineralized fissure vein between blue-gray slate walls, having an east and west strike and an almost perpendicular dip. In the shaft, which at the time of the writer's visit was 11 feet deep, the footwall was shown, but the hanging-wall had not been cut. Resting on the footwall are 1 foot 6 inches of zinc blende and gangue, followed by 2 feet of copper and iron pyrites and blende, and 4 feet of galena, blende and gangue. An average sample across the vein gave 3.6 per cent lead and 1 ounce of silver per ton. A sample of galena and blende taken from a pile of 10 tons gave 18.5 per cent lead and 6 ounces of silver.

The Ning-Hai gold district lies 30 miles southeast of the treaty port of Chifu. Supplies and heavy articles are taken to the mines from the steamer anchorage near Ning-Hai City, 15 miles distant. The geological formation of the district consists of granite, gneiss and mica slates, with occasional interbedded deposits of white crystalline marble and extensive quartzite ledges, which mark out some of the most prominent topographical features of the country. Such a ledge forms the backbone of the Chin-Niu-Shan, or Mountain of the Golden Cattle, which is about 15,000 feet long. By reference to the map, it will be seen that this quartz ledge rises out of a plain to the south 400 feet above sea level, and forms a series of cone-shaped hills whose summits reach an elevation of 500 to 800 feet above the sea, while the gorges between them cut down nearly to the level of the plain. A tunnel has been opened on the ledge at the point shown on the map. Its course is

south for 200 feet, cutting through the quartz ledges, of which there are two at this point, and through the interlying granite and white kaolin selvages. The vein quartz is hard, and white to yellow in color. The sulphurets it contains are sometimes cubical crystals of pyrites and sometimes massive, forming pockets in the quartz. In its length the ledge shows a thickness varying from 10 to 80 feet. It is gold-bearing along its entire outcrop.

Besides the tunnel, extensive prospecting has been done along the whole length of the ledge, both recently under European direction and by the Chinese in olden times. The writer took and assayed 25 samples from this large deposit, which ran from 77 cents to \$5.85 per ton. One assay of selected quartz from a pocket gave \$24.75. The average of ten samples from the tunnel is \$1.55; the average of 13 samples from the outcrop is \$2.19; and the general average of all the samples is \$1.87 per ton, which is too low to warrant the erection of any but experimental works. The plant on the ground consists of two three-foot Huntington mills and two Frue vanners.

The Ping-Tu Gold District.—The Ping-Tu group of mines is situated in the western part of the Shantung promontory, 30 miles from a steamer anchorage and 45 miles southwest of the Chao-Yuen group of mines. The immediate geological formation is gneiss, which, at a distance of 10 miles north and south of Ping-Tu, is cut by zones of highly metamorphosed limestone. The local topography is shown in the figure. The two hills which rise to the height of 220 feet above the shaft house are composed of distinctly bedded yellowish gneiss, striking east and west, and intersecting the course of the vein, which is northeast and southwest. This leads to the belief that the Ping-Tu deposit is a true fissure vein, one of the few that occur in Eastern China, and this theory receives further support from finding breccia in the vein matter.

The mines have been worked by the Chinese for a number of years. Under European auspices and the superintendence of Mr. H. M. Beecher of England, the systematic development of the mine at Ping-Tu was begun in 1886, and a 20-stamp mill, made by the Union Iron Works of San Francisco, with eight Frue vanners and eight Hendy concentrators, was erected. After the mill was in operation, the hoisting arrangements were found inadequate to keep it supplied with ore, and a new fifty-thousand-dollar hoisting plant, with Ingersoll rock drills, was erected under the superintendence of Colonel Ellsworth of San Francisco.

The upper portion of the vein was quite rich. The writer was informed that the first clean-up amounted to \$10,000. When in full operation the mine had a staff of 12 Americans, a very large Chinese clerical force, with its numerous servants, and the usual crowded labor underground and on the surface. As the mine increased in depth, the ore carried less free gold and more sulphurets, and the amount of amalgam that could be scraped from the plates rapidly decreased. The foreign employers, always more or less dissatisfied with the unprofitable mine, gradually left, and their places were filled with Chinese, who had but imperfect knowledge of amalgamation and the general working of a stamp mill. In the fall of 1889 supplies fell short, and, with the failure to receive coal, the mine pumps were stopped and the workings allowed to fill with water.

THE Souvenir Badge for the members of the National Editor's Association has been manufactured by Col. A. Andrews from gold, silver and tin, products of the mines of California. The medal proper, which is of tin from the Temescal mines, is just the size of a silver half-dollar piece, but somewhat thicker. It is suspended from a silver bar pin by two short chains of silver

beads. The silver bar, which is of satin finish, bears the letters "N. E. A." On the obverse of the medal the emblem of California appears in the shape of a small bear made of solid gold, and riveted to the medal with concealed rivets. Above the bear is the word "California," and beneath it the figures "1892." The reverse of the medal bears the legend in raised letters, "Gold, silver & tin products of California."

The Cyanide Process.

A Believer in the Old Style.

TO THE EDITOR:—I have been hearing a lot of late about that new cyanide process for working ores. Now I don't often turn myself loose with a pen. I do most of my scribbling on the rocks with pick, gad and drill, but I've had a good deal to do with mills, too, worked my own ores and had them worked for me, and I think I know what's what about as well as the rest. So I thought for once I'd let the public know what a practical man thinks about this new dodge. I've paid a good deal of attention to the new processes that have been cracked up, one after another, in the last 25 or 30 years, and I notice that no patent or secret process has ever amounted to anything for the miner. California is spotted with the wrecks of crank mills and processes that were going to revolutionize the business—going to but didn't.

The fact is, these patent processes are like peddlers' razors—made to sell, not to be used. They are gotten up to put money in the pockets of inventors, and still more of promoters. When they show me an honest miner who has got rich through this cyanide process, I may take some stock in it. Until then, I for one will stand by the good old way—stamps, copper plates and concentrators, and the chlorine process for the sulphurets. These are old and tried things and no patent process about them, only some of the machinery has patent improvements which any man can see and understand.

In that way an honest miner can take his ore to the mill and have it worked in short order, and see the work done if he wants to, and if he takes his horn spoon and tries the tailings, he can see right away if they are not saving his gold and sulphurets.

I know they pretend that we lose a whole lot of gold that way, but, as I put it up, that's mostly talk to help sell the patent process. I don't take any stock in assays of gold rock, and it's gold rock I am talking about. I know nothing about silver ores. The best assay is one that the miner can make with his horn spoon, and then run a few tons through the mill and see how it cleans up. That's the way the miners have made a living, and sometimes a little more, not by patent processes.

I hear that Almarin B. Paul has taken a great fancy to this cyanide process. Well, that's not surprising; he's built that way. Paul is a gentleman, and well spoken of personally, but he's a crank from way back on process. For years Mr. Paul has been setting up for a prophet on gold milling, but some of us think he's been more of a loss than a profit to himself or anybody else. There's his dry amalgamating process! Who but himself would ever use it? And his Americanized arrastre, too! How much better is it than the old stone arrastre that a man can build for himself and not have a big bill at the foundry? But it seems he got tired of those, gave up inventing things that he couldn't sell, because nobody would take them as a gift, went back to his home-made idols, and is now groveling at the feet of this foreign fetish.

A year ago Paul wouldn't have a piece of cyanide as big as a walnut within a mile of his mill if he could help it, and now he's up to his neck in the stuff. They tell me he eats it on his beefsteak instead of salt. Now Cyanide is just like a horse's tail, a good thing in its place; that is, for cleaning the plates and in the clean-up barrel, and that's all it's good for in a gold mill.

I hear it takes a week or two to work a tubful of ore by this process, for they put it in a great tub and pour the medicine on it, and let the stuff leak through, then pour it on again, and so on. Well, they say the constant dropping of water will wear away a stone, and so I suppose they can wear the gold out by keeping at it long enough.

But fancy a miner going to the mill with his little dab of rock, say ten tons, and having to wait the best part of a month for his returns, with no other amusement than watching a little bit of a stream of water running from a faucet! Or, if he takes a look at the laboratory—for, mind you, the horn spoon isn't in it with these hifaluting

patent processes—he sees a slim young gentleman from the university, or an old fool with a big pair of specs on him to make him look wise. The learned gentleman pours some stuff out of a bottle into some sort of a glass thingumbob with a faucet to it, runs it into another glass jigger, takes it up and looks at it mighty wiselike, and then throws it away; and they call that science, or chemistry, or what not. Why, a live American miner would gape his head off waiting for them—or else go and get blazing drunk.

I've no doubt Mr. Paul knows which side of his bread is buttered. He has rights to sell, and of course he wants to sell them; but, in the meantime, what kind of a show does he give the miner? He has got a custom mill, and Mr. O. H. Aaron, who is a bit of a crank himself, I believe, is stuck on the new process, too, though pretty careful about shooting his mouth off, has shown me his scale of prices. Mr. Paul claims that it only costs about \$150 per ton to work ore to 95 per cent or more by the new process, yet, allowing that he gets out only 95 per cent, he takes toll at the rate of \$31.50 per ton for \$150 ore and \$8.25 per ton for \$15 ore! I call that advertising his wares through the miners, and making them pay him pretty well for doing it.

As I said before, I don't know how it may be in silver, but, outside of the chlorine process, which is an old thing, I don't see that assayers and chemists and scientific smarties, generally, have ever done any good for gold-milling, no more than geologists and mineralogists and all the other ologists have for gold-mining. These latter gentry can tell us all about a mine after the miner has dug holes all through it, but they can't tell the miner where to dig a hole to find pay-rock.

By the way, how is it the State Mining Bureau has not told us about this new process? If there's anything in the thing, as Paul and the rest of them pretend, I think the Bureau would know, and would let us know, all about it; that's what we keep it for, I guess.

Well, I reckon this letter is long enough, too long maybe, but I don't trouble you very often. Perhaps I'm too old to catch on to new things easily; but be that as it may, the old stamp mill and quick is good enough for, yours truly,

A PRACTICAL MINER.

Arizona Onyx.

Arizona Onyx is fast gaining a reputation in the East, and the day is not far distant when most of the onyx used in the United States will come from this Territory. The great beds of this precious stone in Yavapai and Maricopa counties alone, when sufficiently developed, will supply a greater part of the demand. Even now from two to five carloads are shipped from the Yavapai beds, and arrangements are being made to increase the output, and by the 5th of May teams will be moving several tons a day from the Cave Creek mines.

The Yavapai onyx beds, owned by W. O. O'Neil and partners, are probably the most extensive mines of the kind known, being almost a solid body one mile by one mile and a half in extent. At present about 40 men are engaged in taking out the stone, that is being shipped to Chicago, New York, Cincinnati and other Eastern cities, where it is worked into table tops, etc. Probably the largest slab of onyx ever taken out in one piece was dug out of the O'Neil ledge, it being 23x10 feet, and 26 inches thick. The stone from this claim is very fine grain and takes a much higher polish than the celebrated onyx of Mexico, and it contains colors that were exhausted many years ago in the Mexican mines. Then too, the mines of that country never turned out pieces larger than five or six feet square. So far as developed, the Cave Creek onyx beds do not seem to be as large as the Yavapai beds, though the stone is as fine, but even as they are, they will produce large amounts and in blocks of very satisfactory size. J. B. Dougherty, of New York, is doing a great deal of development work, and as soon as the road is completed, which will be in a few days, he will put teams to hauling and loading it on to the cars at Phenix, for shipment to New York.—Phenix Gazette.

The Rolling of Ships.

One fact that often strikes the thoughtful traveler by sea is that, notwithstanding the great and numerous improvements of recent years which have made life on shipboard pleasant and luxurious, little or nothing has been done to steady a vessel when she meets with waves that set her rolling heavily from side to side. The tendency seems to be rather in the direction of increased than of diminished rolling, for the steadying influence of sails, which makes the motion so easy and agreeable in a sailing ship, is fast disappearing in large steamers. Masts and sails add appreciably to the resistance of large, fast steamers; so they have been cut down in size year by year till such fragments of sail as still remain are so small compared with the size of the ship as to retain little power to reduce rolling.

Mr. Thornycroft, the English builder of torpedo boats, boilers, etc., has devised a means of checking rolling by moving a weight, under strict control, from side to side of a vessel so as to continuously balance, or subtract from, the heeling moment of the wave slope. It consists of a large mass of iron in the form of a quadrant of a circle, which is placed horizontally, with the center on the middle line of the vessel, and there connected with a vertical shaft. The shaft is turned by a hydraulic engine, which is very ingeniously controlled by an automatic arrangement. The heavy iron quadrant is swept round from side to side, revolving about its center, to the extent that is required to counteract the heeling moment. In a paper read before the Institution of Naval Architects, Mr. Thornycroft said:

"The manner in which the controlling gear works will be better understood if we imagine a vessel remaining upright among waves, while near the center of gravity of the ship we place a short-period pendulum suspended so as to move with little friction. This will follow the change in the apparent direction of gravity without appreciable loss of time, so that any change in the wave angle and apparent direction of gravity cannot take place without due warning, which will indicate the time and amount of the disturbance. It is therefore only necessary to make the motion of the ballast bear some particular and constant ratio to the motion of this short-period pendulum to keep the balance true. The inertia of a heavy mass will cause some loss of time, as we can only use a limited force for its control; but it is possible to accelerate the phase of motion and overcome this difficulty so far as to get good results.

"If, now, we imagine the ship to roll in still water, the effect of the combination just described will be to balance the ship's stability for a limited angle; but this defect is removed by the introduction of a second pendulum of long period, which tends to move the ballast in the opposite direction to the first one, and enables the apparatus to discriminate between the angular motion of the water and that of the vessel.

"I find, however, that the long period pendulum is rather a delicate instrument, and that its function can be served by a cataract arranged so as to always slowly return the ballast to the center, and this device has the effect of accelerating the phase of motion, which, in some cases, we also require.

"We are therefore able, by very simple parts, to construct an apparatus which will indicate the direction and amount of motion necessary to be given to the ballast at a particular time so as to resist the wave effort. This power of indicating may be converted into one of controlling by suitable mechanism. The loss of time due to inertia of the necessary ballast is not always unfavorable when the apparatus has to extinguish rolling motion, the greatest effect being obtained when the ballast crosses the center line of the ship at a time when it is most inclined to the water surface, and this corresponds to a quarter of the phase behind the motion of the short pendulum."

The apparatus has been working for some time in the steam yacht *Cecile* with very good results. What the objections may be to applying it to the largest passenger steamers remains to be seen. A moving weight of something like 100 or 150 tons would probably be required in such vessels. The power necessary to control the movement of the weight appears to be small, and Mr. Thornycroft's invention seems at any rate to show the way toward obtaining the long-desired boon of substantially reducing, if not checking altogether, the rolling of ships. If it succeed in doing upon a large scale only a portion of what is claimed for it in the way of anticipating and counteracting the heeling effect of waves, without the possibility of acting in an erratic or undesirable way, we may hope to see it adopted some day in passenger steamers.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frus machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center and therefore readily conform to the change of direction while passing over the end rollers, thus the vibration and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffling surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifflings also save very fine sulphurets and the quick lever that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

SHEET
IRON
PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 80 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we laminate the Pipe
in a bath containing a special mixture of ASPHALTUM, BITUM and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalies of the earth, rust, etc., and is practically indestructible.

The Engineers' Visit.

Entertaining the American Society of Mechanical Engineers.

When the members of the American Society of Mechanical Engineers, who are visiting California, came out of the snow-sheds on the western slope of the Sierra, they were met by a committee of ladies and gentlemen from Sacramento and San Francisco and given an abundant supply of flowers and fruit. Mr. H. J. Small, Supt. of Motive Power and Machinery S. P. R., one of the local committee, had made all the arrangements, and they were well carried out. The party from here consisted of Mr. and Mrs. Eckart, Mr. and Mrs. Robert S. Moore, Mr. and Mrs. Geo. W. Dickie, Mr. and Mrs. John Richards, and Mr. and Mrs. Marsden Manson. On arriving at Cape Horn, the train was stopped and the visitors given time to enjoy the view. From there on to Sacramento the ride was thoroughly enjoyed by all. The ladies were especially pleased that a ladies' committee had taken the trouble to come up the road to meet them.

At Sacramento, Mr. Small showed the visitors the railroad shops, and the various points of interest in the city. That night the party went on to Monterey, the escort committee accompanying them. They remained at Monterey Saturday and Sunday, Mr. E. J. Molera representing the local committee, assisting in their entertainment.

On the way to San Francisco on Monday morning, the party stopped at the Stanford University, where Prof. Horace B. Gale escorted them and showed them the buildings and grounds.

The party arrived in San Francisco somewhat later than was expected, and the reception set at 2 p. m. did not come off until 3.30. Mayor George H. Sanderson welcomed the guests on behalf of the city, and ex-President W. R. Hunt, responded.

The reception was of an informal character throughout. On its conclusion, the committee of which A. S. Hallidie was chairman took the guests to the engine-houses of the principal cable roads of the city, where they saw much of interest.

In the evening, the opening session of the society was held at Academy of Sciences hall. The following professional papers were read:

John Richards—"Notes on a Problem in Water Power."

John H. Cooper—"A Self-lubricating Fiber-graphite for the Bearings of Machinery."

Harris Tabor—"Machine Moulding."

O. H. Manning—"A Novel Flywheel."

W. W. Christie—"An Experiment with Aluminum."

On Tuesday morning bright and early, all lands assembled at Washington street wharf for a trip around the bay on the tug Fearless, which had been placed at the disposal of the local committee by J. D. Spreckles Bros.

The weather was delightful and everybody pleased. They went out through the Golden Gate on to the Pacific, but a few rolling swells admonished the committee that the ladies preferred smooth water. The tug turned and passed up through Raccoon Straits to San Pablo Bay and to Mare Island Navy Yard. At Mare Island the visitors were received by Commodore John Irwin, Chief Engineers Moore and Burnett, Naval Constructor J. H. Linnard, Captain of the Yard J. C. Watson, and Lieutenant Le Favor. The foundry, machine shops and construction departments were visited, when the ladies expressed a unanimous desire to see the flowers and shrubbery in the officers' quarters. A botanical expedition was then extemporized with results calling forth the delight and admiration of the Easterners over California's floral possibilities. Visits were then paid by separate parties to the United States ships Boston and Independence and the dry docks.

On the return to the tug, a fine lunch was found ready spread under the awning. Mr. N. W. Spaulding had made all the arrangements for this very carefully, and it reflected credit on his skill as caterer. The trip back to the city was made in a couple of hours.

At a few minutes past 8 p. m. there was a general gathering of members for the evening session in the hall of the Academy of Sciences.

George I. Alden of Worcester, Mass., having taken the chair, the following papers were read by the secretary, F. R. Hutton, in the absence of the authors: "The Density of Water at Different Temperatures," by A. F. Nagle; "Economy and Efficiency of the Steam Engine," by C. H. Peabody; "Some Tests of a Portable Boiler," by W. O. Weber. Albert W. Stahl of the United States navy, stationed in San Francisco, then read

a very clever paper on "Utilization of the Power of Ocean Waves." The paper drew forth a great deal of discussion from various members. Mr. Stahl met all objections in a very able manner, and, having carefully reminded his audience that he was not yet prepared to prove his ingenious invention a commercial success, pointed out that his paper was merely to show what he deemed the best machine for utilizing ocean wave power, as invented to date. The paper was deservedly applauded.

The chairman announced that owing to the extensive program of sight-seeing arranged for, papers set for the next afternoon would be read during the session then being held. The secretary accordingly read the following papers: "The Electric Railway as Applied to Steam Roads," by B. J. Dashiell, Jr.; "An Experimental Locomotive," by W. F. M. Goss. F. M. Rites read his own paper on "The Steam Distribution in a Single-Acting Compound Engine."

The secretary having read a paper "On Compounding Centrifugal and Load Governing by a Rotary Piston Valve," by W. S. Aldrich, the proceedings were brought to a close.

On Wednesday at the invitation of the Spring Valley Water Company, the visiting Mechanical Engineers assembled at the Third and Townsend-street depot at 9 o'clock. A special train was waiting to convey the party, under charge of Charles Webb Howard, president, and Herman Schussler, chief engineer of the company. Some of them were late and had to come on a subsequent train. Arriving at San Mateo the party was promptly distributed in four four-horse coaches and six pair-horse express wagons. The cavalcade then wound in procession through the Howard, Hayward, and Parrott domains, and it would be difficult to say which of these lovely grounds called forth the greatest admiration for loveliness and luxuriance of well tended flowers and vegetation. A long and charming drive through the rich, luxuriant shades of the Pescadero road brought the party to the Upper Crystal Springs Reservoir. Here a temporary halt was called while Mr. Schussler handed round maps of the country and explained the day's route.

Remounting the carriages the procession drove round the reservoir to the big dam, where everyone dismounted and listened to the constructor, Herman Schussler, describe in detail the building of the biggest concrete dam in the United States. Driving on ten miles further on the homeward route the whole procession wheeled in under a big bay tree and dismounted to take seats at long tables covered with enough good things to supply three times the 100 guests assembled.

The Californians welcomed the Eastern visitors and the Eastern visitors dilated upon the enterprise of the Spring Valley Water Works and the hospitality of Californians generally. Charles Webb Howard welcomed the guests. W. R. Hunt replied. Others speeches followed from Frank M. Pixley, A. Sntro, J. T. Boyd, Professor George Davidson, Chief Engineer Moore, U. S. N., and Messrs. Herring, Hutton, Schussler, Yale, Dickie, Hallidie, Kirshaw, Colonel Shafter, J. B. Stetson and one or two others. After a three hours pause over the lunch tables the party remounted and drove homeward to meet their special train.

The cars were sidetracked into the Crystal Springs pumping station yard, where the machine-rooms were inspected and admired, and the big pumps built by the Risdon Iron Works were carefully examined. The trains arrived in San Francisco at 6.30. At 8 p. m. the society convened as usual for their evening session in the Academy of Sciences, Professor G. I. Alden in the chair.

Secretary Hutton read the following papers: On "The Measurement of Power" and "Diagramming Apparatus for the Testing of Materials," by T. Gray; "Two Cylinders versus Multicylinder Engines," by Green and Rockwood. Professor Jacobus read papers on "The Elastic Curve and Treatment of Structural Steel," by G. O. Henning, and "Summary of Results of Principal Experimental Measurements of Performance of Refrigerator Machines," by Denton and Jacobus.

The secretary then read committee reports on "A Standard Method of Testing the Efficiency of Locomotives" and "A Standard for Testing Flanges, Valves and Pumps."

A letter was read from Past President Professor Thurston, suggesting subscriptions from the engineering world toward a fund for the erection of a monument at Colmar, in Alsace, to the memory of the eminent French engineer G. A. Hirn, professor in thermo-dynamics. This wound up the evening session.

Thursday morning early the party went,

on invitation of Adolph Sutro, Esq., to the Cliff House and Sutro Heights. They returned through the Park in carriages, driving from there to the Union Iron Works and Pacific Rolling Mills, where the afternoon was spent.

In the evening lantern slides, illustrating the mechanical progress of California, were described W. R. Eckart, and a reception tendered by Mrs. A. S. Hallidie at her residence occupied the rest of the evening.

On Friday the ladies lunched with Mrs. James Spiers at Berkeley, and drove about that town, Oakland and surroundings, while the gentlemen visited various shops in the city.

The local committee in charge of the arrangements here, was composed of W. R. Eckart, George W. Dickie, of the Union Iron Works, James Spiers, of the Fulton Iron Works, John Richards, editor of the *Industry*, Marsden Manson, engineer of the Harbor Commissioners, E. J. Molera, H. J. Small, Supt. Motive Power and Machinery, S. P. R., Frank Van Vleck, Pacific Railway Co. of Los Angeles, Robert S. Moore, of Risdon Iron Works, and C. G. Yale, editor of the *MINING AND SCIENTIFIC PRESS*.

The ladies' committee consisted of Mrs. A. S. Hallidie, Mrs. W. R. Eckert, Mrs. James Spiers, Mrs. Robert Moore, Mrs. George Dickie, Mrs. Von Geldern, Mrs. Manson and Mrs. Richards.

Taken altogether, the visit of the engineers has been very much enjoyed by them, as well as by the local mechanical engineers. The arrangements were all carried out satisfactorily. All the gentlemen interested lent their aid in every way and greatly assisted the local Executive Committee.

The First Foundry in Chicago, And Also the First One in California.

Howard Louis Conard, in the *Magazine of Western History*, says that the first iron foundry located in Chicago was established and operated by William H. Stow, who became identified with the town in 1834 and resided there continuously up to the date of his death, August 18, 1881. He was born in Log City, now known as Hamilton, New York State, in 1809. At a somewhat early age he went to Syracuse, N. Y., where he served his apprenticeship in an iron foundry and became a molder by trade. From Syracuse he went to Buffalo, where he worked some time at his trade, and there heard of Chicago as a promising Western townsite.

In 1834 he visited the town of which he had heard such flattering reports, secured such assistance as he needed to enable him to engage in his contemplated enterprise, and made provision for the establishment of what was looked upon in those days as an extensive manufacturing plant. This foundry was located on Polk street, near the river, and was operated by the firm of William Stow & Co. The motive power was what was known as the Avery rotary engine, brought from Syracuse, and the first steam engines manufactured in Chicago were made at the Stow foundry, William Avery coming on from New York to superintend their construction. Threshing machines, plows, steam drills and pumps, such as were in demand for use in the construction of the Illinois and Michigan canal, and all kinds of castings were manufactured at this pioneer foundry, which, after being operated for several years on Polk street, was removed to the corner of Randolph and Canal streets.

In this connection it is of interest to note the fact that the pioneer foundry of Chicago was also the pioneer foundry of the Pacific coast. About the year 1845, perhaps 1846, the foundry passed into the hands of Henry M. Stow, a brother of William H. Stow, who in 1849 put all the machinery, fixtures, tools, etc., and all the pig and wrought iron and coal in stock at the time, on board a vessel purchased and loaded by R. K. Swift of Chicago with provisions and supplies of various kinds, which he proposed to ship to California.

The foundry was shipped as ballast, and was nearly a year reaching its destination, the vessel on which it was shipped having passed into the Atlantic ocean by way of the lakes, the Welland canal, and the St. Lawrence river, and reached San Francisco after sailing out to the Azores, through the Straits of Magellan, and over a long stretch of the Pacific ocean. In 1850 Henry M. Stow landed it on the beach at San Francisco, the cost of moving it a distance of 600 feet being precisely ten times as much as the cost of shipping it from Chicago to that point. In May of that year it was removed to Sacramento, Cal., where it was again put in operation. The proprietors of the foundry there were H. M. Stow and H. A. Bigelow, who was elected first mayor of Sacramento. It was located at the junction of the Sacramento and American rivers, and made the first

castings manufactured in California, the price which they brought at that time being \$2.50 per pound. The price of castings in Chicago at the same time probably ranged from 2 to 3 cents per pound, so that the earning capacity of the old foundry cannot be said to have been diminished by its removal to the Pacific slope, although the wages paid to employees—an ounce of gold, or \$16, per day to each man—had a tendency to keep down the profits. This historic foundry was operated up to 1864, when the price of castings dropped to 25c. per pound, and manufacturing them at this figure being considered unprofitable, the enterprise was abandoned.

BOOKS ON ASSAYING.

BY C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and mining precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scoriification; Cupellation; Weighing the Bead; Course Metallurgy; Assay of Ore Containing Lead; Assay of a Specimen; Tests for Ore; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1893. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Oxy Lussac's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$6.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formula as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed with facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the way and wherefore. It contains 158 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

A New and First-Class Book on Perfumery.
JUST READY.
A PRACTICAL TREATISE

Manufacture of Perfumery.

Comprising directions for Making all kinds of Perfumes, Sachet Powders, Fumigating Materials, Dentifrices, Cosmetics, etc., etc., with a full account of the Volatile Oils, Balsams, Resins, and other Natural and Artificial Perfume Substances, including the Manufacture of Fruit Ethers, and Tests of their Purity. By Dr. C. A. Davis, assisted by L. Borchert, F. Eichbaum, E. Kugler, H. Toepfner, and other Experts. From the German by WILLIAM T. BAARNT, editor of "The Techno-Chemical Receipt Book." Illustrated by 28 engravings. In one volume, 18mo, 356 pages, price, \$3.00.

Free of postage to any address in the world.

ABSTRACT OF CONTENTS.

Chapter I. Historical Notice of Perfumery. II. The Perfume Materials for the Manufacture of Perfumery. III. Testing Volatile Oils. IV. The Volatile Oils Used in Perfumery. V. Resins and Balsams. VI. Perfume Substances from the Animal Kingdom. VII. Artificial Perfume Materials. VIII. Alcoholic Perfumes. IX. Dry Perfumes. X. Fumigating Essences, Pastilles, Powders, etc. XI. Dentifrices, Mouth Waters, etc. XII. Hair Pomades, Hair Oils and Hair Tonics, Hair Dyes and Depilatories. XIII. Cosmetics. Index.

The above or any of our Books sent by mail, free of postage, at the publication price, to any address in the world.

A circular of 2 pages quarto, giving the full Table of Contents of this important Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue, of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

OLDSTONE MINING COMPANY, C. J. Clark, M. E. Conl. Supt.
MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for Twelve Months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:
GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrator is the equal, if not superior to any other style of Vanners or concentrating devices.

DAVID McKAY, Jr.,
Supt. North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

Price "Triumph" Concentrators, with Improved (Patented) Belt..... \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt..... \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin it need be.
Circulars and testimonial letters furnished on application.

EMBRACING IN ITS
VARIATIONS OF
CONSTRUCTION
AND APPLICATION

THE PELTON
SYSTEM OF
POWER

THE PELTON WATER WHEEL.

The most distinctively new and important development relating to hydraulic power that has been made in the last half century. Adapted to all conditions and every variety of service where a head of 20 feet or more can be obtained.

OVER 2500 IN USE, AGGREGATING NEARLY 300,000 H. P. Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 to 2000 or more feet. Much better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC POWER TRANSMISSION. The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into especial prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.
MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ore in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

F. A. HUNTINGTON,

— MANUFACTURER AND DEALER IN —

MINING MACHINERY.

HUNTINGTON'S IMPROVED ROCK-BREAKER.

The Main Features of this Machine are Strength, Ease of Adjustment, and Simplicity of Construction.

The moveable jaw A is worked by the eccentric B and is pivoted at the bottom. The stationary jaw D is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt C. The main wear is, of course, at the bottom of this form, and the wear is easily taken up by inserting a plate between the bolt C and the jaw D. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

HUNTINGTON'S PATENT ORE FEEDER.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet-crushing and gold-seiving it has no equal.

I CLAIM ESPECIAL MERIT IN THAT FEATURE OF THIS SYSTEM WHICH PREVENTS ALL FLOURING OF GOLD AND QUICKSILVER, and the consequent loss of gold that attends stamp-milling.

For the economical working of ore that contains sulphurets, I particularly claim the adoption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S PATENT SHINGLE MACHINE.

This machine is so well and favorably known by all the principal lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. Send for Circulars.

Retorts and Melting Furnaces.

On this page are shown the smaller pattern of cylinder retorts and melting furnaces combined in one setting, such as are

through which a continual supply of cold water flows, condensing the vaporized quicksilver while passing through it to the settling tank. The time required to retort a charge of amalgam depends largely upon

the retort to the fire, insuring a uniform distribution of heat to all parts of the retort. The hand rihs which surround the retort prevent warping. Its supporting brackets are placed centrally, so as to admit

Yosemite and other parts of the State. Mr. Kirchhoff was born in San Francisco, but for many years has been a resident of New York. He was editor of the *Engineering and Mining Journal*, before taking his pres-

FRONT VIEW.

LONGITUDINAL SECTION.

CYLINDER RETORT AND MELTING FURNACE FOR GOLD MILLS.

FRONT VIEW.

LONGITUDINAL SECTION.

IMPROVED CYLINDER RETORT FOR SILVER MILLS.

used in large gold mills and small silver mills.

After being thoroughly strained, the amalgam is placed in the retort, in suitable iron pans; the retort is then sealed, except the vapor discharge pipe, the open end of which is placed under water in the condenser tank. A water-jacket condenser is fixed to and surrounds the vapor pipe,

circumstances, and varies from one to four hours.

The other cuts show a standard 14x60 "silver" retort, embodying Mr. Boss's improvements, by which the usual objectionable bearing bars are entirely dispensed with, the retort having a series of brackets cast on its sides, which rest on the brick walls, exposing the entire lower surface of

of turning the retort over and using both sides, thus increasing its life materially. Retorts and melting furnaces of these patterns are made in this city by the Risdon Iron Works.

MR. CHARLES KIRCHHOFF, editor of the *Iron Age*, of New York, has been paying a visit to San Francisco, after a trip to the

ent position on the *Iron Age*. While here, Mr. Kirchhoff made quite an extended visit to the Pacific Steel Barge Works, Everett, Wash., and several others will be commenced later on.

A 5000-TON WHALEBACK STEAMER will be started at the Pacific Steel Barge Works, Everett, Wash., and several others will be commenced later on.

Sale of the Minarets Mines.

Englishmen Invest in Iron and Silver Properties.

A very important sale of mining property has been effected by Messrs. Allen & Anderson through their London agent. This firm is interested in the well known Minarets iron and silver mines, situated at the Minarets, about 70 miles from Fresno.

Strange to say, says the *Fresno Republican*, though the wealth of mineral deposits in the neighborhood of the Minarets is generally known, the owners have been unable to get American capitalists to interest themselves in the development of the mines. They tried for two years to secure American capital with which to operate the mines, and had finally to go into foreign money markets.

About three months ago Messrs. Allen & Anderson put the property in the hands of a London agent, who with but little trouble succeeded in interesting an English syndicate. Negotiations were at once begun, and after a few cablegrams had passed between London and Fresno, a sale was effected. The sale is subject to the report of the expert whom the syndicate intends to send to Fresno county to examine the mines.

The price agreed upon has not been stated, but it is said to be very large. The expert will arrive in Fresno some time in June and the sale will be concluded immediately after his inspection of the mines. There are six of these; two iron and four silver mines.

The iron mines are really two huge mountains of iron, 1500 or 1600 feet in height. No shafts need be sunk, for the ore can be quarried, like rock. All who have been at the Minarets and know anything about mines, say, that not in any other place on the globe can anything like the iron mountains at the Minarets be found. The ore is free-milling, and there are 14 different classes of it. There is iron there in great quantities from which the finest Bessemer steel may be made. None of the ores are rebellious, and they are entirely free from sulphur. There is magnetic, hematite and what is called Norway iron in inexhaustible quantities. A representative of the State Board of Mineralogy, who visited the Minarets recently, stated there was enough ore in sight to build a double track around the earth, and that the supply was practically inexhaustible.

Captain Allen, of the firm of Allen & Anderson, was asked concerning the reported sale of the mines mentioned. He expressed much regret that they could not have been sold to American capitalists, and said he tried to dispose of them in a foreign market only after he had given up all hope of doing anything here. Captain Allen, of course, is confident that he and his partners have one of the best mining properties in the world, and is certain that the syndicate's expert will be more than satisfied with result of his inspection.

"The iron assays about 67 per cent," said the Captain, "and no better ore can be found anywhere. Here are the assays of four specimens made by Mariner & Hoskins of Chicago: No. 1, iron 66.3, silica 4.57, phosphorus .128. No. 2, iron 66.13, silica 4.27, phosphorus .454. No. 3, iron 67.20, silica 4.40, phosphorus .454. No. 4, iron 62.90, silica 6.35, phosphorus .748. Some of the ore assays as high as 80 per cent.

"As for the silver mines, I doubt that there are richer anywhere. The ore is of the kind called ruby silver and is of the finest imaginable. It is, like the iron, free milling. The few assays made show several thousand dollars to the ton. There is no doubt that the mineral wealth of the Minarets region is surpassed by no other on the globe, and its development will bring a prosperity to Fresno county that will exceed even what it has already experienced in that respect."

The mining industry of the county, which has so long been neglected, will receive an impetus from this sale, the importance of which it is impossible to estimate too highly. While the mineral wealth of the Minarets has been known to many for a long time, there was always a belief that it could not be utilized, or would not be for many years, on account of the locality being so difficult of access. This view is valid no longer, for the San Joaquin railroad is being built in that direction, and if the Minarets are all that is so enthusiastically claimed for them, a feeder would of course be run up to them. The Minarets are already 22 miles nearer than they were last summer, and it is stated that the mountain railroad will be extended 40 miles farther this summer, which would bring it within six miles of the mines.

The outlook, therefore, is most encouraging, and the owners of the mines mentioned have some reason for their self-congratulation. There will be a general revival in mining in Fresno county this year.

Welsh Tin-Plate Makers in America.

There have recently been rumors current to the effect that some of the large makers of tin plates in Wales were contemplating the removal of their tinning plants to this country. According to the *N. Y. Iron Age*, events have come to notice which go far to confirm the rumors and put them into a very reliable report. A most important enterprise of the kind is the project of E. Morewood & Co., the well-known Welsh tin-plate makers, who have already secured some three acres of land at Elizabethport, N. J., where they have excellent facilities for rail and water shipment, and they intend to be tinning plates there by the latter part of the summer. The ground is ready for the buildings, and work is to be begun immediately. The plans for the tinning apparatus are being prepared in Wales, and though it is not yet definitely stated how many pots will be put in operation, the firm intimates that they will coat about 5000 boxes per week. Their American representatives, George B. Morewood & Co. of New York, say that the Welsh firm do not intend to cease making plates abroad, but will continue their works there as the demand warrants. The plant that they are proposing to erect at Elizabethport will be for tinning purposes only, the black plates being made in the foreign mills and brought here for coating, the product being both tin andterne plates. It is the intention of E. Morewood & Co. to begin the erection of very large works as soon as this plant is in successful operation. The larger enterprise will be located somewhere in the West, and will include a rolling mill as well as a tinning plant, the idea being to have an ultimate capacity of from 12,000 to 15,000 boxes per week.

The firm of E. Morewood & Co. are one of the best known in Wales, they controlling two works—one at Llanelli, including 13 mills, with a capacity of some 7000 boxes per week, while the works at Swansea contain 21 mills, with a capacity of some 11,000 boxes per week. The plates made by this concern are Siemens-Martin steel of first and second grade, the best known brands in this market being B V coke and Grange charcoal bright plates and P T L ternes. Of course, the operation of the Welsh mills will depend upon the demand, and at present it seems likely that the reduction in the demand from abroad will be permanent. It must be remembered, however, that there is a large call for plates in this country by canners and others, who reexport and who get practically the whole of the duty returned. Such manufacturers will prefer a foreign plate unless the domestic article is very much below the importing price, because by using the Welsh product, they can save a considerable amount of money. The quantity of plates reexported is, roughly speaking, one-third of the total consumption, so that however successful the efforts may be toward making plates here, there will surely be a large foreign demand for some time to come.

It is also reported that W. H. Edwards of the Ely Tin Plate Works, at Cardiff, is preparing to set up a tinning plant at or near Philadelphia on somewhat the same plan as the Morewoods are about carrying out. Mr. Edwards is also very well known in the tin-plate trade, being a son of Daniel Edwards of the Dyffryn Works. According to report, the black sheets will be made at his Welsh works, and brought here for tinning only; but the home plant will, however, continue in operation, so far as the demand for the product warrants.

The Financial Rewards of Mechanics.

We so often hear it said that "smart" men no longer adopt mechanical professions or pursuits, that we fear many young men may be misled, and many older ones disappointed with their choice of occupation. It is true that many of our "smart" men will not, nor will they adopt any calling imposing any considerable toil upon them. They want to get along by their wits, not their muscle. Surely, well-meaning boys should not be guided by the action of such chaps. There are others who are not lazy nor careless how they make money, but who are over-fastidious, and consider old clothes, grease, dirt and honest, manual toil degrading, even though it requires much brain work also. They may be nice fellows, but they seldom amount to much, and very, very often come at last to that alleged degradation so carefully shunned in their youth. It is not to be expected that such men will ever enter a shop.

Those who talk most about the men of ability steering clear of mechanics think that all the ability comes from the upper-middle, as generally known, and aristocratic classes. The proportion of such people who

now take up mechanical work is greater than it ever was, but the pessimists do not consider that the poor, from which class the shops are recruited largely, furnish more brains and genius than the comparatively well-to-do classes.

Drones and easy-going men will not progress in any walk of life, and there are many mechanics as well as men of other callings who get along poorly. But, on the other hand, there are many professional men, clerks, accountants, etc., who would be far better off if they were skilled workmen in some mechanical capacity. There are instances without number of mechanics rising from a humble position in the shop to great power, influence and wealth, by using their brains and applying themselves to the work in hand. How many have exempted themselves from daily toil by inventions, and by starting in business for themselves in a small way? Thousands in every State.

There are whole wards in Cleveland, owned principally by mechanics, who bought their homes, furnished them comfortably, many elegantly, and sent their children to school, often to college, on their wages. They are in better shape, with better prospects of ease in the future, than the majority of small merchants and salaried store and office help. There are, in fact, few men so independent as a first-class machinist, sober, reliable and industrious, who owns his home, has some money in the bank and a business-like administration of household affairs. How many doctors, lawyers and other men who, when they were turning the corner of boyhood, would call him a "poor fool" for learning a trade instead of going to some "varsity" and getting crammed for a profession, would now be glad to swap positions with this man? You can find them in every block, in every square, in a city or town.

The one who has in him the metal to succeed on the line of his natural adaptability and preference, will find, if his ability lies in the mechanical direction, that there is a broader and infinitely better opportunity for emolument in the machine shop now than at any previous period.—Scientific Machinist.

The Red Cedar Shingle Business.

It is now acknowledged in the East that red cedar shingles from this coast have obtained such a foothold in some markets that no other kind can be sold to any great extent. Carpenters like them because they are light to carry aloft, because they are wide and because they can lay them rapidly. The house owner likes them because they will stand the test of time. Numbers of new shingle mills are being erected on the northwest coast, especially in the State of Washington—so many, in fact, that the question arises, "Will the business be overdone?" The *West Coast Lumberman*, in speaking of the subject, says:

The above question is often asked but seldom answered twice alike, but usually with many ifs and provisos. The question presents problems that are new and perhaps not susceptible of a positive solution, but from the general "layout" we think a reasonably safe answer can be made in the negative. It is true that shingle mills are going in rapidly. At no time in the history of this coast has the increase been as marked as it has since the close of last season's business. Mills are still going in, and it is safe to say that at the close of this year the cutting capacity of our shingle mills will have increased from 75 to 100 per cent over the past year's capacity. Not that the number of mills have increased to that extent, but a large number of the old mills have added new machinery. The statement from actual figures is that one large machinery house in Seattle has sold machinery in the past few months which has a daily cutting capacity of 2,500,000 shingles, or more than 6000 cars a year. This is more than was shipped last year from this section. So much from the affirmative side of the question. Now what have we to offset this? Let us see: In 1889, Manistee, Michigan, manufactured in round numbers 525,000,000 shingles; in 1891 the output had dropped to 200,000,000, or but 25,000,000 over one-third of the former cut. Again, at Muskegon, Mich., was formerly located what was known as the Irish mill, with a daily cutting capacity of 750,000 shingles. That mill was burned last year and will not be rebuilt. We note these two cases on account of their magnitude. Men who are posted say that throughout the districts which were formerly devoted to making white pine shingles the number of mills has greatly decreased. A case at hand is that of the Stinson Mill Co. of Seattle, which has abandoned their large shingle plant in the East, but now manufacture red cedar shingles at Ballard. Again, it is evident that the demand is growing at an unexpected rate, and the fact that our millmen are behind with their orders at this

early date in the season is proof of the growth. Wholesale lumbermen in the East are trying—often without success—to contract for large quantities of our shingles. No better argument could be made for our side than that. It should not be expected from shingle makers that the demand will continue in advance of the capacity and a lull will follow, but nevertheless, by a fair construction of the rule of supply and demand, we believe that the former will not exceed the latter.

Mining in British Columbia.

During 1891 the banks at Victoria, British Columbia—according to the official return just to hand—exported gold to the value of \$358,176. It is estimated that, in addition, about one-fifth of that amount was carried away in private hands, and so we get a total of \$429,811, against \$429,436, the total for 1890. With occasional slight recoveries, the gold output of the colony has fallen off steadily since 1875, when the total was \$2,474,904. Occasionally, in the earlier history of British Columbia mining, the output exceeded \$3,000,000. It would appear from these figures that gold mining in that somewhat neglected and yet promising province of the Dominion has seen its best days; but such is not the case. During the ensuing season we are promised a boom in Kootenay, where a vast mining camp is in process of formation, and experts assure us that British Columbia possesses through its length and breadth vast stores of mineral wealth. The principal metaliferous regions of the province extend laterally from the Rocky mountains to the coast, and include the Selkirk, Purcell, Gold, and Cariboo mountains, the interior plateau, and the coast ranges, corresponding roughly with the regions of the Coeur d'Alene and Bitter Root mountains of Idaho and Montana, the Great Basin of Utah and Nevada, and the western slopes of the Sierra Nevada. Through these regions, belts more or less defined occur, containing valuable deposits of the base and precious metals, of which those in Cariboo (gold, gravel and quartz), in the Selkirk (argentiferous galena, copper, and associated ores), in the Nicola (gold and silver sulphurates), and in the canyon of the Fraser (gold gravels) have been so far prospected. "Everything which has been ascertained of the geological character of the province," said Dr. Dawson, of the Geological Survey Department of the Dominion of Canada, in a recent report, "tends to the belief that so soon as similar means of travel and transport shall be extended to what are still the most inaccessible districts, these also will be discovered to be equally rich in minerals, particularly in the precious metals, gold and silver."

The fact is, mining in British Columbia, having enjoyed a lusty and somewhat extravagant youth and an early manhood of privation; seems to be on the verge of a prosperous middle age. The great success which, in the early days of the gold discoveries, attended the enterprise of placer mining, induced abortive efforts in the more serious and expensive work of quartz mining. The difficulties of transport and the cost of development were not realized; and so the companies formed in these circumstances came to grief. In the meantime there had been a considerable development of the railway system, although, in this respect, much remains to be done. Mining enterprise is guided by wiser heads, with firmer hands, and the friends of British Columbia declare that the era of successful quartz operations has begun. Of West Kootenay, in particular, the report of the Minister of Mines says: "Though no mine in the district is, as yet, fully worked with adequate capital and labor, invested in the hope of realizing dividends, the offers made and the high prices paid for promising prospects, together with the steady work undertaken by claim owners in the Toad Mountain, Ainsworth, Trail, Goat River and Illecillewaet camps indicate that there soon will be in the district mines worked systematically on a large scale, some of which, no doubt, will become dividend-paying properties." The detailed reports from the various centers are full of promise. Placer mining is still carried on in a limited way; but the days of the sensational results that were obtained in the fifties from the rich placers of the Fraser, and in the sixties from Williams creek, are at an end. Steady development, with the aid of the latest inventions of modern science, is the order of the future, and so the judicious investment of capital may bring its liberal reward.

Silver, lead, iron and copper also exist in considerable quantities in British Columbia; but its most important mineral export is, at present, coal. During 1891 more than 1,000,000 tons of coal were produced—the largest figure by far ever reached in the his-

tory of the industry. Here are the comparative figures for four years:

	Output. Tons.	Export. Tons.
1888	459,300	365,714
1889	579,830	441,675
1890	578,141	508,270
1891	1,029,097	806,479

Owing to the absence of an equitable reciprocity treaty between Canada and the United States, within the past few months excessive shipments of coal from distant countries to California have so disturbed the balance of supply and demand that existed during the greater part of last year, that a prudent diminution of output and shipment of coal took place generally from British Columbia, in order to ease off the glut that was brought about by such extraordinary deliveries into California; but it is expected that the market will speedily assume its normal condition. The collieries of Nanaimo, Wellington and Comox were never in better condition than now, and prospects never looked so well for putting out coal. It is well known that vast coal deposits exist which have never yet received attention. In short, the province of British Columbia seems to offer a field of more than common promise for enterprise and investment.—London Financial News.

What Is a "Miner"?

The Anthracite Mine Law of Pennsylvania (1891) states (Art. 8, Sec. 4): "Certificates of qualification as mine foremen and assistant mine foremen shall be granted by the Secretary of Internal Affairs to every applicant who may be reported by the examiners, as heretofore provided, as having passed a satisfactory examination and as having given satisfactory evidence of at least five years practical experience as a miner."

What constitutes a "miner," however, is not defined, and the real meaning of the word is the subject of some dispute.

It seems that some candidates on presenting themselves for examination have been refused the right to sit because they could not give satisfactory evidence of having mined coal for five years. Is this right?

When we speak of any craftsman, we speak of a man who is competent in all branches of his trade, and who is especially competent in the more important and dangerous branches. It is very rarely, however, that we find in any trade a man who is an all-round, first-class workman. In large industries it is well known that the greatest amount of work can be got out of a certain number of men by apportioning a particular piece of work to each, and we must be content therefore to consider any man an artisan who has a good knowledge of the most important branches of his trade.

In reading the law under question, we must consider the object which it is intended to accomplish. It is called "An act to provide for the health and safety of persons employed in and about the anthracite coal mines of Pennsylvania, and for the protection and preservation of property connected therewith."

The intention of the section of the law under consideration is to provide competent foremen, and the workman who knows most about all the work in mines will make the best foreman, as the more he knows, the better able is he to protect life and property.

We do not think five years coal hewing is a sufficient training in this respect, and personally we would rather trust ourselves underground with a man of five years general experience than in the care of a man who has done nothing but hew coal for the same period.

According to law, any man who has labored underground two years can receive a certificate that he is a miner, and if a miner is to mean only a coal hewer, then, after working only five years, perhaps in a single chamber—with never a thought only to secure so many cars of coal a day—and with no experience in timbering, track-laying, bratticing, door-building, or any other branch of the work except cutting coal, he can present himself at an examination and be allowed to sit, while the man who has had experience at all the work but digging, and who for years has had charge of the doors and brattices and timbering, which supply pure air and safe travel to the digger, is refused the right to sit.

The term "miner," as used in this section of the act, must certainly mean a workman in the mines who has had five years of general experience in the work underground, and who understands the practical details of every branch of the underground work well enough to qualify him to be a competent foreman.

THERE are 512,407 telephones in use in this country, requiring 266,456 miles of wire, which on an average allows a trifle over half a mile of wire to each instrument.

Mining Around Black Hawk, Plumas County.

Messrs. Thompson & Kellogg, merchants of Spanish Ranch, and A. Smith, of Butterfly, are coowners in four quartz locations, which, says a correspondent of the Quincy National, are situated on the divide between Blackhawk creek and Upper Butterfly valley, and are proving their faith by their work in the way of developments. They have done a vast amount of prospecting up to date, and have developed a splendid body of pay ore, both in shafting and drifting. They have two shafts sunk on the veins, one 77 feet in depth and the other 50 feet; also a tunnel running on the vein a distance of 127 feet, both shafts and tunnel showing a well defined ledge of gold-bearing quartz encased between a contact of porphyry and slate, varying in width from four to seven feet and assaying in free gold (as near as I can learn) \$16 to the ton, and carrying from five to seven per cent gold-bearing sulphurets assaying into the hundreds. They are at present driving a bedrock tunnel, by contract, to cut the ledge on a lower level, which is 360 feet, and have crosscut three different veins of quartz, 3, 4 and 18 feet wide, all of them carrying free gold and gold-bearing sulphurets. They are still driving the tunnel ahead.

The Golden Gate quartz mine, formerly known as the Jackson ledge, situated on the Snake Lake divide, is also looming up as a gold producer of this district. Messrs. McLaughlin and Stephan having leased this property, have a force of men employed putting in machinery and getting ready to crush ore, which is free milling and is not low grade.

David Bushman and Henry Orr are contemplating sinking a shaft on the old Dr. Coleman ledge, situated at the junction of "Liza's Fork" and Blackhawk creek, and from which, so rumor says, Dr. Coleman pounded out in a hand-mortar over \$1500 from less than ten tons of rock. The correspondent, in 1878, ground sluiced and shoveled into boxes what Dr. Coleman had thrown out as waste, and realized \$11 in free gold for two days' work. This ledge is also encased in porphyry and slate and carries gold-bearing sulphurets.

Messrs. Greves & Bushman have the extension of the above location and intend to do some development work on it this spring. H. P. Wormley is at present doing development work on a fine ledge of quartz, situated on the ridge between Jackson ravine and Newtown flat.

Lee, Richard & Blakesley are engaged in sinking a shaft on the Emigrant Hill divide, and have a splendid body of quartz in sight some 18 feet in width and carrying free gold and gold-bearing sulphurets.

Frank Thomas, having faith in the old Bell location, has done considerable work to uncover the ledge on this side of Emigrant Hill, and has met with success.

All the above locations are good, fair, legitimate ore bodies, and all run parallel with the country rock, N. W. and S. E., and are one continuous vein or ledge, opened and prospected by shafts and tunnels, so as to justify me in saying that the quartz outlook for Blackhawk mining district is just a booming.

The placer mines in this district are holding their own and giving fair returns for the amount of work being done and the mode of doing it.

Thomas & Thompson have a force of men employed on the Emigrant Hill claim, and are pushing the work night and day.

Messrs. Bennett & Bell, having leased the Newtown Flat claim from Mr. Leavitt, are at present washing up the dumps.

David Bushman is making preparations to commence drifting in the Coleman ravine.

Music & Shafer are still at work on Blackhawk creek, trying to realize money enough to buy out the German Empire and make it a free, great and glorious Republic.

Richard Perry is doing some prospecting on Jackass Ravine Hill channel.

Taylor Hill is still busy at work on Little Blackhawk, segregating the potato-raising soil from the gold-bearing gravel by means of a ground sluice, and, rumor says, is meeting with fair success.

Alf. Smith and J. L. Kelley have been running a tunnel on Butterfly creek this last winter to bottom the old river channel in the bill known as the Panama claim. They have run 170 feet of open cut and tunnel and have developed a fine body of gravel. They have one of the finest hydraulic properties in this district if they could be allowed to work it under that system; but as it is, they are trying to find a streak that will pay to drift.

Lucas & Scott are operating on the east branch of Feather river, as is V. B. Kelton and Mr. Race.

A New El Dorado Reported Found.

Col. F. H. Garcia and Mr. B. V. Garcia, accompanied by Captains Aguilera and R. Mallen, says the Tucson (Arizona) Citizen, have returned from Sierra Pinta, the newly discovered gold bonanzas in Sonora, Mexico. The Garcias have obtained a concession or mining zone, quadrilateral, 18 miles long by 12 miles wide, which covers the Sierra Pinta on the San Francisco mountains, the same covering the gold-bearing country near Salinas Bay, on the Gulf of California. Captain Aguilera, as chief of the Geological Commission of Mexico, examined the formation and the auriferous deposits, and Captain Mallen surveyed and established the lines and boundaries of the grant. Within this zone are the celebrated mines of the Pacheco's (the discoverers) and Mr. Cervanti, and two or three other locations that were taken up prior to the zone being granted to Messrs. Garcia, and, of course, those locations will be respected and are the property of the original locators, but everything outside is now the property of the zone grantees. The party remained on the ground about 50 days, during which time they made numerous discoveries of gold-bearing veins, some of them showing greater riches than the Pacheco and Cervanti mine. They found in the San Francisco mountains, joining Sierra Prieta, and within the property of the zone, a richer deposit than any yet discovered in that region. They brought numerous samples, chippings from the outcroppings they discovered, every one showing gold to the naked eye. The mountains appear to be cut up by the innumerable quartz veins, varying from an inch to several feet in thickness, and among them there are many that show gold visible, and will pay to work.

The present trouble is the lack of water, but a well is being sunk now which, if successful, may facilitate the working of mines. However, the mines are but seven miles from the seashore, all along which fresh water in abundance is found within a few feet from the surface, and sometimes springs of fresh water gush up, lapping the salt of the gulf.

The intention of the grantees is to make a short railroad from the mines to the seashore, where to erect the reduction works, and to bring to the mines water, in pipes or otherwise, for use of the mines, and get other supplies, wood, provisions, etc., by the sea. In this way, the expense of building the road will soon be counterbalanced by extending the source of supplies, and save immeasurably in freights of machinery, materials and supplies, the expenses of which, by using the regular overland route, even with the Guaymas road to help, sometimes multiply by three and four times the original value of the goods, when delivered at the mine.

Col. F. H. Garcia and Captains Aguilera and Mallen left immediately for the City of Mexico, to make a report of the work done and perfect the concession, prior to starting the more thorough examination of the property and beginning work.

These great gold deposits have been saved from the grasp of men so long, owing to a belt of 15 miles of arid country that separates them from water on the side of the settled part of Sonora. While at the mines themselves, it is as dry as dry can be, on the seashore the country is deserted since the mines were left alone. But now, such is the wealth of these mines that it pays to pack water for man and beast, for working and extracting the ores.

LONG CABLEWAYS.—Warner & Warner, of Seattle, Wash., write to the *Engineering News* concerning long-span cableways. They say: "We have designed, erected and have in operation at the Culver Mining Co.'s property in the Peshastin Mining District, Wash., an endless ropeway, 6140 feet in length, for transportation of ore from mine to mill. As originally erected and operated it had two spans of extraordinary length, viz.: 2197 ft. and 1750 ft. We later on reduced this 2197 ft. length to 1783 ft. by putting in another station, although there was no physical reason for so doing. Extremely long spans are not economical and should be avoided where possible. The rope is crucible steel, 5-8 in. diameter, and was loaded on the long spans to 1800 lbs. The usual speed is four miles per hour. This is the first bucket tramway erected in the State. It works satisfactorily, and in addition to carrying return loads to the mine, it develops 10 to 12 HP. for use at the mill."

ABOUT the lowest price for pig iron is a rate of \$9 per ton for the product of Alabama furnaces; though during March a quotation of 35s. 3d. was made in London for Cleveland (English) pig. Prices in Belgium, France and Germany have also touched very low figures recently.

Formation of Slate Rocks.

Prof. J. L. Lohley, in a paper read before the British Society of Architects, has the following in reference to argillaceous rocks: No clay rocks produce valuable stone except the slates. Slate rocks are metamorphosed clays, and are of various geological ages. The fine slates of Carnarvonshire are some of Cambrian and some of Silurian age, while those of Valencia, on the southwest coast of Ireland, are Devonian, and those of Cork are carboniferous, and on the continent of Europe there are mesozoic and even tertiary slates.

The term slate, like that of marble, requires definition, for some fissile limestones, locally used for roofing purposes, are incorrectly called slates. A true slate, like a true marble, is a metamorphic rock, and so has a changed structure, from which organisms have been eliminated by the metamorphosing heat, and possesses new characters that make it a quite different rock in all except chemical composition.

The great and essential character that distinguishes a slate is slaty cleavage, which is quite distinct from ordinary rock cleavage in having its direction across instead of parallel or coincident with the plane of original bedding or deposition. Thus most limestones, especially those used for flagging split quite in accordance with their bedding planes, but a Penryn or Festiniog slate splits either at right angles or at a high angle with the original stratification of the unaltered rock.

It is now established, through the observations and experiments of Sorby, D. Sharpe and Prof. Phillips, that this new and remarkable character has been given to the rock by the great lateral pressure to which it has been subjected, and which has changed the direction of the longer diameters of the particles forming the mass from a horizontal to a more or less vertical direction, and has, in addition, to some extent elongated them. This action of the forces of nature has been imitated artificially with successful results, an arrangement of layers of matter having been converted by great pressure at the sides into a mass in which no layers were to be found, but instead vertical cleavage planes. The pressure to which these rocks have been subjected has been accompanied by great heat, which has converted clay rocks into the semi-crystalline stone called slate, and imparted to it a very close and dense texture, which makes it weigh 170 pounds to 180 pounds to the cubic foot, and gives it a resistance to a crushing force of 20,000 pounds to the cubic inch. The transverse strength of slate is greater than that of any other stone.

The mineral of which all argillaceous rock are essentially composed is kaolin, a pure white clay, consisting of silicate of alumina. The chemical elements of all clays, shales, and slates are therefore aluminium, silicon and oxygen, and we must consequently trace the origin of slate through the history of the formation of a bed of clay. Kaolin is produced by the decomposition of the feldspar or feldspathic rocks, such as the granites. This is washed into streams and rivers, and so is conveyed to the sea, where, consisting of matter in an extremely fine state of division, it is carried farther from the shore than is the siliceous sand, and so is deposited separately, which produces an accumulation of argillaceous or muddy material that subsequently becomes a bed of clay.

Like sandstones, beds of clay are not altogether or even mainly directly derived from the parent source, for old clays furnish material for newer clays, and these again are subjected to denudation and provide argillaceous matter for still newer argillaceous accumulations.

Clays of the older rocks that have long been subjected to vertical pressure have been compacted and hardened into shales and mudstones, and when these at great depth have been subjected to high temperatures and to great lateral pressure they have been converted, as we have seen, into the hard and strong roofing slate. The extreme tenacity into which slate will split, and the perfect parallelism of the planes of cleavage, as well as the density and strength of the material, are well exemplified by the specimens exhibited in the Museum of Practical Geology, where there is one specimen five feet long and only one-sixteenth of an inch in thickness produced by simple splitting.

As compared with May of last year, very few men are now out on a strike. Last year the coke ovens were largely idle, and many industries badly crippled or seriously threatened thereby. This showing is a favorable one for the present year, and may be taken as an earnest for the future. The last half of 1892 promises to develop unusual activity in almost all lines.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Alameda.

PETROLEUM.—Pleasanton Times, May 24: For the past two years Pleasanton has made a reputation for itself in the discovery of several very important features little dreamed of by the most sanguine of our inhabitants. When the well borers struck artesian water at the depth of only 60 feet, our people were greatly surprised and overjoyed. The flow from this well fills a seven-inch pipe, and has kept it up for months past. When they found terra cotta beds, equal to any in the State, they knew that a large and prosperous business would spring up, if the right kind of people took hold of it. When natural gas was struck in the Odd Fellows' Cemetery, and word reached town, the excitement knew no bounds, and the whole town turned out to see the newly found product of the soil. This find was telegraphed all over the world, and has been the means of bringing many strangers to our town. And now comes our latest discovery, in the shape of oil, by Wm. Napier, on the Hardin ranch. We kept the find secret for some weeks, but as the matter has become known through the filing of legal documents, the cat is out of the bag. Mr. Napier found a substance oozing out of a side hill, on the above-named ranch, which, on investigation, was found to be a very fine lubricating oil, and is thought by many to be in large quantities. This fact, however, can only be found on developing the oil hole. A very satisfactory test has been made by Mr. Price, the San Francisco chemist. An agreement has been entered into and placed on record, wherein the Hardin heirs give Wm. Napier the right to prospect on 484 acres of land, for the period of ten years, with the option of an additional ten years. Work must be commenced within six months, and should gas, oil or minerals be discovered, he must work the well or mine. The Hardina are to receive seven per cent of the net income.

Amador.

AMADOR GOLD MINE.—Amador Ledger, May 21: It is pleasing to be able to chronicle some facts which indicate a speedy settlement of the legal troubles in which this property has been involved for nearly two years. This week the lien men—those whose liens were for labor—were all paid off by John P. Darling, the representative of the American stockholders. The amount paid is something near \$4000. Reports are flying around that the two contending factions, the American and English shareholders, have reached a satisfactory basis of settlement, and that all the claims will ere long be paid. Indeed, the payment of these liens is a pledge that the other debts will be settled. The men who received their money this week agreed to throw off the interest. It is thought likely that matters will be arranged so as to start up the mine again this summer. Cochran, the principal English stockholder, has received a sheriff's deed to the Amador Queen mine, and paid the taxes on that property last week. This is believed to be a really good property, and if incorporated with the Amador gold mine, which doubtless it eventually will be, there are strong reasons for believing that a big and remunerative property would be the outcome.

Butte.

RESUMPTION QUARTZ MINE.—Oroville Register, May 19: Yesterday Wm. W. McMillan of Hurlston showed us some very fine specimens of gold-bearing quartz from the above-named mine. The lode is situated about two miles southwest of Hurlston and is about 300 yards from the Phoenix mine, now being operated by Col. Frary. Some work had been done on the lode in the past, but this rich quartz was discovered by Mr. McMillan about the middle of March. He sank on the ledge 16 feet and found the vein two feet in width. Water came in so freely that it was impossible to sink deeper at that time, but now he will go as deep as he can. The rock is very rich, and from the indications will go from \$50 to \$100 a ton. There are a number of ledges in the vicinity and from some of these in former years large sums were taken. The sulphurets from this lode were assayed and they went as high as \$779 a ton. The ledge has been followed for a distance of about 1000 feet. At the top the lode is only about eight inches wide, but it has widened to two feet in the bottom of the shaft. Should it continue to widen as it descends and prove as rich as it is now, Mr. McMillan has a bonanza that will bring him a fortune. The Phoenix mine near Hurlston, operated by Col. A. P. Frary, is getting better every day. The shaft is now 85 feet deep and the lode at the bottom is four feet in width. Four men are given employment and it is the intention of the superintendent to sink as deep as possible before any mill is built to work the ore.

Calaveras.

INDIAN CREEK MINES.—Citizen, May 21: Indian creek mines are being prospected to some extent. Among them our reporter notices that Cook & Co. are making preparations to sink a shaft, with good ore croppings. Meyers, of the Josephine mine, will resume work on it soon. The Marie and Christmas Gift mines show large bodies of good ore, and parties have been investigating them, with a view of taking hold and developing. On the same veins to the west are the Reddick, Solinsky & Cuneo mines, with fine and well developed cropping. Other mines in this vicinity are being prospected, and we do not doubt but ere long the Esmeralda and Indian creek mines will be known for what they are worth, and a genuine boom will be seen.

AT CENTRAL HILL.—Work on the Last Chance gravel mine at Central Hill is being vigorously pushed by Mr. Albert Mauna, the

superintendent, for the owners—a San Francisco company. Mr. Mauna is an experienced miner, and the company was fortunate to secure a good manager. This claim is between Judge Reed's and Cassinelli's, the shaft being down 175 feet, the last 90 feet being sunk in 45 days by six men in eight-hour shifts. It is expected that another 50 feet will reach bed-rock and disclose a rich body of gravel that is known to run through the claim. The Cassinelli claim is also being prospected for the same channel by a tunnel over 1200 feet in length. At last accounts good pay gravel was coming in.

El Dorado.

TAYLOR.—Georgetown Gazette, May 21: The Taylor mine, in all of its departments, is fitted with an incandescent lighting plant, aggregating 100 electric lights of 16-candle power. Experiments are being made to operate both the pumps and drills, but the practicability of operating these has not yet been satisfactorily determined.

SMALL MILL.—Martin, Ambrose & Co. are equipping their mine on Bear creek with a two-amp mill—water power—and will begin work of developing and thoroughly prospecting the mine. At Kealey, John Knight is driving a tunnel this side of the schoolhouse, to drain the Red Hill mine so it can be worked.

Modoc.

FREE GOLD.—Alturas Herald, May 21: Encouraging news comes from Willow Ranch this week. Robinet & Barnes discovered ore in their mine that carries free gold. It is decomposed ochre and there will be no trouble to work it. They will soon have an arrastre finished and then we can expect shipments of bullion from that mining district.

Nevada.

TWO NEW MINES.—Grass Valley Tidings, May 20: Messrs. Fred. Zeitler, J. S. Ott, E. Woerner and J. A. Reed of San Francisco arrived here Sunday. These gentlemen, with friends, recently incorporated the Western Star M. Co., the mine adjoining the North Star on the west, and are here to inspect the property and determine upon future operations. There is a tunnel in on the claim a distance of 475 feet, and men have been set to work to run it 200 feet farther. Then a plant will be put on and a shaft sunk. The incorporators believe they have a good property—they undoubtedly have—and propose to develop it as fast as possible. Mr. L. P. Goldstone, who represents these and other gentlemen as Superintendent of the Jack Rabbit mine of this district, the Champion of the Nevada district, and the St. Gothard, near the Delhi, has charge of the work on the Western Star.

JACK RABBIT.—The shaft is down 235 feet and sinking is in progress. The ledge, which was broken up by a crossing, is coming in again in good size and the ore of good grade. A GOOD CRUSHING.—Grass Valley Telegraph, May 20: On Thursday a crushing of 18 loads of ore from the Norambunga mine was completed. The ore was crushed at the Joe Southern mill and yielded \$25 per load. The rock came from the upper tunnel in the mine. Faucett & Co. are working the Norambunga and the mine is owned by Wm. Campbell and others. Ore from the mine has paid as high as \$65 per load and the present workings will soon reach a rich pay chute.

GOOD PROSPECTS.—Grass Valley Telegraph, May 23: This afternoon our people were startled at the prolonged noise of a whistle. It kept blowing until the more timid thought that some mining accident had happened. It was nothing of the kind. It was simply the signal that a new mining enterprise had set itself in the now already well-filled firmament of mines. The Oak Tree mine, belonging to Mr. Brock and sons, have their pumping and hoisting machinery now in place and will start work in earnest in the morning, at which a night and day shift of men will be put on. The whistle this afternoon sounded a joyous note. The Oak Tree is situated a short distance from the present Peabody shaft, and it has a shaft down 80 feet. To-day, Mr. Brock showed a piece of quartz taken from the ledge in the bottom, and there was a streak of gold about the size of your finger running entirely through the quartz. A crushing from the mine, and it was completed a few days since, paid \$60 per load. The ledge so far averages about one foot in thickness. The machinery now in use on the Oak Tree mine is that which was at one time used on the California mine. The Champion M. Co. of Nevada City is making many improvements around its premises, especially in the milling department. Mr. Wm. May of Grass Valley has been engaged by the company to remodel the mill, and that he will do the work to perfection goes without saying. Ten stamps are being added, which will make 25 in all, and there will be 11 Frue vanner concentrators at work; new mortars have been put in; a sulphuret house and dry will also be added to the plant, and in a very short time the mill and its equipments at the Champion will be second to none in the country. The last load of machinery was hauled to-day to the Hudson Bay ground, and in the morning the work of putting the machinery in place will be commenced. The machinery consists of hoisting and pumping gear, and Mr. Tregidgo, the superintendent, will push the work forward as fast as possible. It is reasonable to hope that the Daisy Hill mine will soon be in operation. Papers have been drawn up to that effect, but further than that, nothing has been done.

OSBORN HILL MINE.—Grass Valley Union, May 25: The work of reopening the Osborn Hill mine is to be commenced soon, as all arrangements have been made for steam pumping machinery, and a portion of the working force has been engaged. The backwardness of the season, and the absence at Washington of John E. Hobson, who is interested in the enterprise, has delayed operations until this date.

Plumas.

FROM RICH GULCH.—Plumas National-Bulletin, May 19: From A. D. Hallsted, who came up from Rich Gulch, Saturday, we learn that all the drift mines in that section are at work. Mr. Hallsted himself is working on Gray's Flat. Fred Lewis, Capt. Corser and Joe Hallsted are mining on Rich Gulch. Henry Patten is operating the Duncans claim, and has good prospects. Wm. Konradi, Philip and Wm. McElroy are at 12-Mile Bar. C. R. Halls ed, John Murphy and Francis Jackson are working on Taylor Flat. All are busily engaged, and seem to be doing reasonably well.

GENESEE.—Mr. Brandt has been working in his mine and preparing his mill for the season's crushing. Gus Graham, one of the owners of the Green ledge, is very ill. Brown & Sikes have the mine leased, and are working it. The arrastre is running, and the prospects are good. McDonald & Bordin are driving a tunnel on their claim near the Genesee mine. Mr. Gruss is operating the Genesee mine, and he is reported to be doing well. The mine is supposed to be rich. On Grizzly creek, W. S. Dean and two other men are at work washing gravel and with good results. A. Joseph is sinking a shaft on his claim. Chas. Morain is taking out good pay on Grizzly Mountain.

San Diego.

PROGRESO.—Julian Sentinel, May 19: To our mining industry five new quartz mills have been added and many old and new properties opened up, some of which have been put upon a paying basis. The Bailey brothers, for 22 years identified with the mining development of the camp, have recently remodeled their machinery and completed the finest water-power in Southern California. They are now preparing to add an electric plant, and when the works are complete, will be by far the greatest improvement the camp has ever witnessed and will mark a new era in the history of this region.

Shasta.

AN OLD MINE.—Dunsmuir News, May 20: M. D. Butler of the Tamarack quicksilver mines went down to Delta a few weeks ago and purchased an abandoned mine about four miles west of that place. The mine had a shaft 100 feet deep, and Mr. Butler cleaned out the old shaft and commenced sinking it deeper, where he struck a bonanza. The rock is literally sprinkled with free gold. He does not know yet just how large the ledge is, but he is confident of it containing gold enough to make him rich the remainder of his life.

TWO RICH CLAIMS.—Redding Free Press, May 21: Vandever and Bullard are making some money on Flat creek—in fact, they have a good mine and are in a fair way to lay up a neat estate. Their tunnel is 250 feet long, and their ledge is four feet wide, rich enough to work clear across. They made a partial clean-up recently of their arrastre from a ten-days' run, and brought to town 11 ounces of good gold, averaging \$19 to the ounce. While their rock is free-milling, yet they must lose more or less fine gold by the arrastre process. They have crushed 30 tons of rock altogether, and have no fault to find with the result. Below this claim on Flat creek a miner named Joe Holman recently panned out \$28 in one day, and one piece of gold and quartz recently brought to town weighed \$9. It is a rich ledge, from which \$28 can be panned in one day! This rich claim is not far distant from the place where a man named Young found a \$600 lump a few years ago.

NOTES.—Ore is now being hauled from the mines on Flat creek to the Shasta mill. The Calumet Co. will soon have 14 large tanks operating on the MacArthur-Forrest process machinery for the new mill of the Gold Run Co., which is putting in the MacArthur-Forrest process, passed up the road this week. M. D. Butler of the Altoona cinnabar mine was in Redding this week exhibiting to his friends some very rich rock taken from the old Whitlow mine near Delta. Mr. Butler purchased the mine of Whitlow, which has been developed by a tunnel 250 feet long. About 200 feet in, Mr. Butler found traces of a good ledge and immediately set a force of men to work. The first blast let off uncovered a splendid ledge of fine ore. The people of Delta are rejoicing over this new find.

NEVADA.

Washoe District.

A NEW DEPARTURE.—Virginia Enterprise, May 22: Yesterday morning Supt. Ryan of the Hale & Norcross inaugurated an entirely new departure in the working of the mine that is of very unusual interest, and which may be followed by results of not only great benefit to stockholders, but Comstock mining interests in general. The departure consisted in the beginning of repairs to the incline below the 1640, or Sutro tunnel level, with a view to opening it up to the 1800 level and the establishment of mining in that part of the mine. In the original sinking of the incline years ago, the haste to reach the lower levels prevented the prospecting of the mine at all between the 1700 and 1900 levels. The ground between these levels is therefore to-day an unknown land—an unexplored country, a storehouse of possibilities, a repository, as it were, of potential bonanzas. Supt. Ryan proposes to explore it and bring to light whatever it contains. This is an encouraging undertaking. The block of ground to be prospected is very large, and within its area there is plenty of room for an immense amount of ore. This is the first resumption of mining below the 1640 level, or the Sutro tunnel, since the Combination closed down and deep mining ceased in 1886. Between the 1600 and 1700 levels the mine has only been partially prospected, and there is room for large developments in that neighborhood. It is also known that there was no ore in the 1900 when work was stopped there. If this departure should prove

successful, and profitable ore developments be made, the sentiment favoring the resumption of mining in the lower levels all along the lode will receive an impetus which may be followed by great and lasting results.

CONS. CALIFORNIA AND VIRGINIA.—Chronicle, May 21: There has been extracted from all parts of the mine during the week 1064 1600-2000 tons of ore which was shipped to the Morgan mill, the average value of which, per car samples, was \$29.57 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was \$26 per ton, per battery samples. Bullion shipped to the Carson mint, assay value, \$14,830.90. Bullion now on hand in our assay office, assay value about \$14,500.

OPENING.—1465 level.—In working easterly from the mouth of the north drift, from the drift run west from the winze 122 feet below the sill floor of the 1300 level, we have extracted and raised to the surface during the week 20 tons of ore, the average assay value of which is \$21.70 per ton.

MEXICAN.—On the 1405 level from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, a north drift was started and has been advanced 11 feet in porphyry.

UTAH.—340 level.—From the west crosscut, at a point 595 feet from the shaft, the north drift has been extended 54 feet; total length, 170 feet; continuing in vein porphyry showing some quartz and clay.

ANNE.—During the week west crosscut No. 3 from north drift on east side of the ledge advanced 21 feet and work suspended in the face for the present; formation quartz and soft porphyry.

BEST AND BELCHER.—900 level.—East crosscut No. 1 has been advanced 19 feet through hard porphyry; total length, 159 feet. West crosscut No. 1 has been advanced 19 feet through hard, barren quartz; total length, 241 feet.

GOULD & CURRY.—On Sutro tunnel level the joint north drift with Savage Co. has been advanced 19 feet; total length, 473 feet; face in porphyry.

HALE & NORCROSS.—On the 900 level are stopping out ore from above this level, and stopes continue to look about the same as last report. Retimbering main drift from the shaft. Hoisted from this level during the week 270 cars of ore. 1000 level.—Have opened a working station at this depth from the bottom of 900 north winze and started a south drift from same; face of the drift shows considerable quartz, but of no value. 1100 level.—Stopping out ore from north and south stopes above this level. No particular change in the stopes. Extracted from them during the week 255 cars of ore. 1300 level.—Have opened a new winze station 125 feet north of shaft, and will commence sinking below this level during the coming week. Also opening a new working station at head of the main incline. To-day began the work of opening the main incline below Sutro tunnel level, with the intention of later opening an 1800-foot level from the incline. Hoisted during the week 525 cars of ore. Shipped to Brunswick mill 429 1510-2000 tons. Average assay of railroad car samples of ore shipped to Brunswick mill for the week \$21.52. Average battery assay for the week \$14.81. Shipped from Brunswick mill to U. S. Mint, Carson, bullion of the assay value of \$7,547.36.

CHOLLAR.—We are making the usual amount of repairs on the 450 and 750 levels. The north drift from the bottom of the shaft, 930 level, has been repaired for 300 feet north of the shaft.

POROER.—Extracted and sent to mill in the past week 381 1300-2000 tons of ore from the 930, 1100, 1150 and 1250 levels. On hand at mill, 80 600-2000 tons; average battery assay, \$22.18. The joint northwest drift from 1800 level of the Ward shaft is out from the station 400 feet; face in porphyry.

BULLION.—The joint Potosi winze is down 300 feet below the 1500 level; bottom in quartz that gives low assays. East crosscut, 320 feet south of north line, 1300 level, is out 142 feet; face in porphyry. The drift started south at a point 28 feet east of the west boundary of the quartz in the east crosscut, 320 feet south of the north line, 1300 level, is in 36 feet in quartz yielding low assays.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer 1800 level of Ward shaft, has been extended during the week 30 feet; face in clay and quartz.

OCCIDENTAL.—The west crosscut from the south drift, 400 level, is in a total distance of 110 feet, and continues in a favorable formation, carrying seams of pay ore. The north and south drifts from this crosscut have been extended during the week and show a little pay ore.

CON. NEW YORK.—The north drift from No. 4 crosscut, 650 level, is out 23 feet; face in ore of fair grade.

Osceola District.

GRAVEL.—Cor. Salt Lake Journal, May 21: At Osceola they are working 50 men on the different claims of the Gravel Mining Company, and everything denotes a long and prosperous run. At Sacramento, Woodman & Co. are at work taking out ore. The dry washers have been idle owing to the damp weather, but they are getting out and opening up dirt, ready for a prolific summer's work.

Minervia District.

DISCOVERIES.—Cor. Salt Lake Journal, May 21: Some rich discoveries have been made in Minervia district. In fact, the whole county is full of renewed life and energy, and the prospectors are meeting with good success both in new finds and development.

Eureka District.

EUREKA CON.—Sentinel, May 21: President Fries of the Eureka Con. Mining Co., accompanied by his wife, arrived here last Saturday. The result of this visit is a change in the management. Al. Burt, who has had charge of the

Eureka Con. mine for the past four years, is retired, and H. C. McTerney, who has acted as secretary of the company, has been appointed superintendent. The cause of this change is stated to have been complaints of triniters to the president that Mr. Burt did not give them a fair show. No one attempts to depreciate Mr. Burt's worth as a thorough and competent miner, but he has unmistakably made a number of enemies through the stringent measures that were adopted for the management at the mine. He left last Wednesday for Ogden, where he has business interests, and from there he will take a trip to England. Geo. W. McKim has been appointed night watchman at the mine in place of Wm. Harris, and other changes are talked of.

Ely District.

Not Sold Yet.—White Pine News, May 21: Reliable reports from Ely, White Pine county, are that the Joanna and Chaimmen group of mines have been sold to the Colorado parties that have been negotiating for this property for a year. If the sale has been made, Ely will be the best gold camp west of Black Hills.—*Ely Independent*. Onr neighbor is right in the last sentence. The first, however, is a little mixed. The present Colorado parties have not been negotiating for these properties more than six weeks. No sale has been consummated, though the arrangements looking to that end are as perfect as can be without a transfer of property.

White Pine District.

PEACOCK BULLION.—White Pine News, May 21: Newt Boyd dropped into our office a few days ago and laid upon our case a nice little bar of gold bullion weighing 37½ ounces, the product of 27 tons of Peacock ore worked at the Ely mill. The ore averaged about \$20 per ton and milled perfectly free. The boys have about 200 tons of ore on the dump that will mill \$10 to the ton. But the expense of handling it across the valley and mill charges will not permit of this ore being worked. The Peacock is one among the most promising mines in this section for the work done on it, and with more development and a mill of its own would in a short time become a good bullion producer.

MONTANA.

ABOUT PLACER MINING.—*Inter-Mountain*, May 17: Placer miners are very jubilant this year, and anticipate one of the best seasons in many years for their business. The mountains and gulches are filled with snow and an abundance of water to wash the gravel is assured. In the vicinity of Butte the Chinamen are the most industrious followers of placer mining. They go to work in diggings which pay only \$2 per day and are satisfied. The ingenuity of the Chinamen very frequently comes to notice, and it has been illustrated in the business of placer mining. It is well known that under the United States laws Chinese cannot take up public land for any purpose. They manage, however, to get the land to work, if they don't get title to it. They get white men to take up their placer claims and pay them \$10 per month for every Chinaman employed on the ground in placer mining. This system of doing business has been going on for some time in the Highland placers, and prospectors have made a comfortable living, at the same time working their quartz claims and receiving a monthly income in advance from the Chinese. Last week a gang of ten Chinamen left for the Highland mountains, south of this city, to go to work. They will enter upon an old claim, which, it is said, will not pay over \$2 to the man per day. But that satisfies the Chinamen who are employed by companies. Frank G. Lamson has received word from C. C. Frost that he has organized a company to work placer ground in the Highland district. It is said the ground which this concern will work embraces ten miles in Fish Creek gulch. Mr. Frost starts for Butte to-day from Norwich, Conn., and he expects to be in active preparation for the season's work by June 1st.

OREGON.

GOON PROSPECTS.—*Eugene Register*, May 20: Mr. E. C. Smith has returned from his trip to his mines near Riddle, Douglas county, and brought home some fine specimens of gold picked up there. In one bottle he had about \$5 worth of gold which a boy had washed out with a hand-sluice in a day. The ground all around is very rich. Those residing there have been washing out considerable this winter. Mr. Smith is now working up a stock company to develop the mines. They are figuring on a new plan of obtaining water for hydraulic mining. That is, instead of tapping streams to obtain water, to establish a pumping station on the banks of the Umpqua river, which is close at hand, and pump water from the river and force it into a reservoir at the head of the flume. At this place this can be done very readily, as the water will have to be raised only about 400 feet and be forced through a pipe a distance of a little over one mile. They are figuring on this plan now, and think that it will be much cheaper than digging a large number of ditches to tap the small mountain streams.

UTAH.

CAMP CROSSCUTS.—*Park Record*, May 21: Repairs at the Marsac mill have been completed and the stamps are again dropping on ore. The mill is now in thorough condition for another year's steady grinding on Daly ore. Just now the mines are suffering from the annual spring flood of surface water, and the extraction of ore and prosecuting developments are consequently greatly handicapped. As soon as the snow melts the trouble will be obviated. The Glencoe is reported to be looking better to-day

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

CRUSHING MILL.—Chas. E. Philes, Stockton, Cal., assignor of one-half to Thomas J. Smith. No. 475,284. Dated May 17, 1892. This is one of that class of crushing mills in which centrifugal spring rollers are employed, said rollers operating in a pair and being pivotally hung from a revolving driver above. The invention consists in a novel spring acting on the rollers to hold them positively to their work against the ring-die of the pan. The object of the invention is to provide a simple and effective spring for this purpose which can be readily applied and easily removed to enable any roller to be taken out, said spring being durable and not liable to injury or deterioration due to the severe jar in the operation of the machine. The spring may be adjusted as the rollers and die are.

DIET GRADER.—Wm. P. Ball, Fresno, Cal. Assignor to Truman, Hooker & Co., San Francisco. No. 474,896. Dated May 17, 1892. This invention relates to that class of dirt separators prepared with a bowl adapted to be turned by a rearwardly projecting handle, said bowl being connected by draft rods or links with a draft power in front. The chief object of the invention is to provide means for enabling the operator to turn the bowl to any point which he may desire, whereby its contents may be discharged in greater or less volume over the ground and be equally spread thereon. The particular object is to provide for limiting connections with respect to the bowl and to its connected parts in such a way as to provide for simplicity, economy, and general effectiveness, and ease of adjustment.

REVERSING GEAR.—John F. M. Woods, Oakland, Cal. No. 475,026. Dated May 17, 1892. This is a reversing gear for steam engines. The invention consists essentially in a cylindrical valve seat adapted to be oscillated, and provided with suitable ports so arranged that by its oscillations they shall be brought into changed relations with the ports of the valve and cylinder to effect the reversal of the engine. The object is to simplify the reversing mechanism of an engine by dispensing with all link motion and also dispensing with one of the eccentrics usually employed to effect the reversal by reversing the valve itself.

DIFFERENTIAL GRAB.—Geo. Cottrell, S. F., assignor to the Joseph Wagner Manufacturing Co. No. 474,903. Dated May 17, 1892. This invention relates to a novel device for applying power by means of a differential gear. It consists of an internal drum or gear, a spur gear of smaller diameter, the teeth of which mesh into the teeth of the internal gear, an eccentric by which the spur gear is given a throw, so that its teeth successively engage those of the internal gear, and a movable guiding disc or cross, operating in connection therewith.

FRUIT PITTING.—A. G. Carter, Fresno, Cal. No. 474,901. Dated May 17, 1892. The object of this machine is to provide a simple and effective way and means for extracting fruit pits, and especially and particularly for removing the pits of clingstone peaches. This mode or method has for its basis the holding of the pit and its severance from the flesh by a twisting action, gained by a rotary or partially rotary movement imparted to the flesh while the pit

is held stationary, or to both flesh and pit in opposite directions. This method, while applicable to various fruits, is especially serviceable in stoning clingstone peaches, as it will take the flesh off quite easily and leave but little on the pit.

WATER FRONT OF FIRE BOX FOR BOILER.—J. T. Charest, Red Bluff, Cal. No. 475,035.

Dated May 17, 1892. This invention has for its object the construction of a boiler furnace with surrounding walls and a hollow front wall, a hollow bridge wall, and connecting and circulating pipes by which communication between these hollow walls and the interior of the boiler is maintained, and controlling cocks to cut off any of these connections so that the hollow front wall, the bridge wall, connecting pipes or the boiler itself may be blown off and cleaned independently of each other.

Mining Share Market.

SAN FRANCISCO, May 26, 1892.

The market continues lifeless, with no encouraging features to note, notwithstanding that extensive prospecting and developing work is being done in each group of mines on the Comstock. If the conditions were different, this work would have a telling effect on the share market, and shares would be selling several times higher than the "laundry men" have them quoted on two exchanges. Briefly stated the unfavorable conditions are as follows: The rotten market, not to say the way in which Comstock mines are looked at, if we accept the developments in the Hale & Norcross suit as a fair sample; continued assessments, with the work being done, not calculated to show up much, if any, ore, for it is evidently pushed only far enough to get near ore without striking it; no speculative spirit manifested either here or at the East; and the low price of silver which takes away a very large percentage from the silver bullion sold. This last is a heavy drain and which, no doubt, has considerable to do with the unsatisfactory condition of the share market.

While the large majority of operators in mining shares are bears, made so by the unfavorable surroundings of the market, yet there are a few pronounced bulls. The latter say that the most important work that is being done, is toward the West or Red lode, and this being gold-bearing, the price of silver should have very little effect. The bears claim that the gold ore is taken from mines lying to the west which may lead to litigation. The bulls claim that through the efforts of the Mining Stock Association, assisted lately by the Brokers' Combine, the mill rings on the Comstock are being forced to conform to the law, and that mine-lotting will be a thing of the past. In substantiation of this, they cite the weekly letters of the superintendents of Hale & Norcross, Overman, Savage and Con. Virginia. The bears claim that these reports being a forced proceeding, the mill ring will certainly continue mine-lotting, but in a way that will come the worst of all, and until it is over, there will be no chance for creating a speculative movement in mining shares. The above outline of divergent opinions is given to let each reader form his own opinion which side is the nearest correct.

The movement inaugurated in the Comstock district calculated to down the mill rings, and have the mines more honestly worked, is due to the strong and determined fight waged by the Mining Stock Association against the mill rings. In their fight they have lately been assisted by a combination of several leading brokers to force the rings into the market to buy shares with which to control the mines. Of course, after each contest the shares of the mines contested for, go up a piece, while the story is under way more market activity and outsiders are able to sell out and afterward buy back at a good round profit.

A special meeting of stockholders is called by the Weldon and the Peer Mining companies to make some kind of disposition of the shares now in the office of the respective companies. The majority of the Comstock shares, is due to a contest by the Brokers' Combine for control of the mine. Outside shareholders should stand in with the combine. A reformation is wanted in the Gold Hill group of mines and this contest offers the desired opportunity to secure it.

The secretary of the Mining Stock Association should invite another force of outsiders to the offices of the Savage, Potosi and Con. Virginia mines, requesting that they conform to the law more fully; half way conforming should not be tolerated. The Overman management might also be notified with good effect. The Hale & Norcross weekly letters, so far as we know, fully conform to the law.

It is claimed that the Manuel Eyle suit against the directors of several mines on the Comstock will be compromised soon after the Supreme Court reversed the decision of the Superior Court, and that Judge Hunt's decision in the new trial was expected. In other words, there was no genuine fight.

Car sample assays are reported by the Hale & Norcross, Overman, Con. Virginia and Savage companies. The assays reported by these companies are such that the Bulwer Mining Co. will in July next, commence the regular monthly payments of dividends. It is also asserted that Bodie is to be assessed, after which there will be a good move in the shares. It is said that the Con. Pacific mine is being lotted.

Information is made public that in Hale & Norcross important work will soon be commenced to open up two lower levels. The company has money in hand and it looks as if the officials are determined to squander it on work that is not at all necessary at present. There is very rich ore on the upper levels; why not take it out? There is talk of deeper work in Con. Virginia; this mine, like several others on the Comstock, has rich ore on the upper levels. In Stockton, the Union, Mexican and Onitash are important work has been and is being done, but it is questionable if it will benefit any one except the inside rings. It is said that in Best & Belcher some ore that was not taken out and milled by another company, is liable to be struck for stock juggling purposes. In Savage they are fooling around a body of good milling ore. Potosi continues to be worked as does Con. Imperial and Challenge, but no one, outside of salaried officials and mill owners, is benefited. Now that Bullion has levied an assessment they ought soon to report a rich ore strike. Assessments must be collected. In Alpha and Exchequer they are not, so far as outside letters go, doing any important work, but it would probably take the upper levels found to the west about three years ago. Mystery still shrouds the work in two or more of the mines. Very secretive miners are now employed.

From the outside mines our advice are uniformly favorable from the Bodie district, Tuscarora district and the Bodie district, but it would probably take a mountain of gold to get outside operators to buy the shares of the mines in the above district. Years ago talk and a few paid puff in newspaper sold stocks, now something more substantial is necessary,

MECHANICAL PROGRESS.

Dry-Crushing Machinery.

At a meeting of the Society of Engineers held at the Town Hall, Westminster, Mr. Joseph William Wilson, junior president, in the chair, a paper was read by Mr. Samuel Herbert Cox, on "Dry-crushing Machinery," and an abstract is published in *Iron*. The author having stated that the improvements of recent years in chemical and metallurgical processes had rendered necessary the introduction of dry-crushing machines, affirmed as a first principle of success, from an economical point of view, that it was necessary to use the different machines for the work only for which they were designed. While admitting that it was, perhaps, difficult to draw hard and fast lines for the work of machines, he thought no trouble would be experienced in defining the main duty of different classes of plant, or their combination in the most efficient groups. Pursuing this principle, he stated that it was uniformly advantageous to employ two stonebreakers, set to different gauges, to reduce the stone to such dimensions as would enable the fine crushing mills to work most effectively, and that the stone should be screened after each operation in order to avoid passing material through the machinery which was already fine enough. He then alluded to various forms of fine-crushers, *e. g.*, the Marsden fine ore-crusher; stamper batteries; Krom's rolls, and Coward's Niagara mill, which he described, touching lightly also on the various ball machines such as the Globe mill.

While admitting that each of these possessed certain advantages he gave his unhesitating support to the Krom rolls as the most efficient for dealing with hard rock and reducing it to a fine powder. He gave, in illustration, a description of a plant of this class which he had recently erected, stating, that with a 12-nominal horse power semiportable engine and boiler, the whole plant, consisting of two stonebreakers, one pair of Krom rolls, three elevators, and one dust exhaust-fan, was driven in a thoroughly satisfactory manner. The total cost of this plant, including buildings and erection, was £3,000, and the capacity, through a 40-mesh sieve, 30 cwt. per hour. The small number of wearing parts in a plant of this description is very important, as also is the fact that the rolls can be run until the tires wear to about 1/2-inch thick, when they are easily replaced. The uniform nature of the products in which these machines differ greatly from most other crushing and grinding machines is moreover of the greatest value.

The combination of crushing and grinding in the same machine may generally be looked upon as wrong in principle, tending to make a larger proportion of dust, which in subsequent wet treatment would result in slimes. Referring to the numerous disintegrators which are also used for dry-crushing, the author pointed out that, although they were sometimes employed on stone, the high speed at which they were driven, and the necessarily somewhat heavy wear, involved constant repairs when they were used for this purpose, but, in their own province, *viz.*, for crushing softer and somewhat elastic materials, for which any direct crushing plant would be useless, they are unequalled; and where the material to be treated contains some moisture and is liable to clog ordinary screens, they are infinitely superior to all other types of machinery.

THE subject of street car fenders has again been investigated by a commission appointed by the West End Ry. Co. of Boston. One hundred and twenty-nine different fenders were submitted to the committee for examination, and they were classed as follows: Buffers, which soften the blow given to the person by the car, and pick him up in a net; platforms projecting beyond the dashboards, upon which a person could leap, or upon which a body could be caught and carried along; fenders below the car platform, whose object it is to push along a body lying on the tracks, and prevent it getting under the wheels. Three methods of operation were also disclosed: Where they are always in place ready to catch a body; where they require the action of springs or other device operated by the force of the blow struck by the car upon the body; where they require the direct action of the motorman to put them in operation. After careful examination of all these, the commission believe that public safety can be increased by the adoption of possibly two devices, as follows: A movable platform projecting in front of the car platform with an elastic buffer or stout wire or metal strips, and curved so as to project from the front dashboard and receive the blow of a person's head and shoulders on a yielding surface.

This buffer could be easily detached and changed from one end of the car to the other. The meshes of the buffer should be large enough to enable a person to seize it with his hands. The second device is to prevent a person who has fallen and is lying on the track from being run over by the wheels. The commission are not yet prepared to make any specific recommendations as to the latter device, but require more time for investigation and experiment.—Chicago Jour. Com.

A Wonderful Machine.

Twenty-two years ago, in the city of Rochester, N. Y., James W. Paige began the work of constructing what at that time seemed an impossible machine. Assiduous labor, persistency of purpose, and an indomitable will finally crowned his efforts with success, and Dec. 24, 1890, in the city of Hartford, the inventor saw his work completed—a work which all who have been granted the privilege of seeing have pronounced the greatest mechanical invention of the age.

True, the machine does not talk, says the *Chicago Tribune*, but it reasons; reasons with its operator. It is a type-setting machine, and is called "The Paige Compositor," and it does the entire work of composition, setting ordinary movable type with far greater speed, accuracy and artistic effect than has ever before been accomplished by any method. The machine automatically distributes, and at the same time sets the type indicated by the operator, automatically spaces and justifies the matter without mental effort on the part of the operator, places it in a galley ready for book or newspaper, as desired, records the number of lines set, and "leads" the matter as and when required. All of this is accomplished by means of positive mechanism.

This machine is not to be confounded with any other machine, nor should it be called a mere type-setting machine. To see it in operation, to note with wonder its marvelous performance, one who understands, and even one who does not understand, the method of type-setting by the human printer, would call the machine a compositor in the truest sense of the word, as it performs simultaneously all the work of a human compositor. In an apprenticeship of less than 40 days, an operator has set 86,121 "ems" of solid, standard nonpareil in eight hours, an average of 8515 "ems" an hour. These figures are wonderful when one takes into consideration the fact that the average printer of to-day sets about 700 or 800 "ems" an hour with his time of distribution also considered. The machine, as has already been said, distributes its type while it is also setting. The work is all done simultaneously.

The machine is run by one-twelfth horse power and is now in private practical operation at Fifteenth street and Western avenue. It is probable that the directory of the World's Fair will offer one supreme prize for the best mechanical invention of the age; also one for that of electricity. For the former "The Paige Compositor" will be a competitor. That it will be the successful one is instantly and unstintingly accorded by all who have been to see it.

"I can print," says Mr. Paige, "a 200-page book, at a cost of \$5, in twenty minutes. The operator has only to watch the keyboard and copy, and the machine will do the rest. An operator can average three or four characters at each touch of the keys, and this machine is the only one in the world for which there is no excuse for an error in proof."—Chicago Journal of Commerce.

JAPAN is stated to be building a navel steel works for the manufacture of armor plates, for which £375,000 will be required. The want of a sufficient supply of good quality iron ore in Japan has been strongly urged by the opponents of the scheme, but the great wish of the nobility to make the empire independent of foreign manufacturers, in case of war, has caused this objection to be overruled.

THE Krupp Works at Essen contain 2542 furnaces, 430 boilers, 83 steam hammers, 21 roll-trains, 450 steam engines, and 1652 machines for various purposes. The number of cannon turned out is over 21,000, and more than 20,000 workmen are employed. An average of 1666 tons of coal and coke is consumed daily at the works.

SINCE the supply of natural gas began to fail and the pressure of what remained was lowered, many companies in the Eastern gas fields have been pumping it. The pumps are like the large air compressors used in mining, but with different valve arrangements suited to the nature of the gas.

SCIENTIFIC PROGRESS.

PRACTICAL USES OF GEOLOGY.—Though the practical value of geology has been, and still is, well demonstrated, there is a certain class of well-meaning persons who, from want of due consideration or lack of information, fail to see any direct benefits from the study of stones. Appended are a few hints regarding the worth and results of geology. As a statement, geology is the sum of all the sciences, the foundation, the support, the very anchor that holds the rest, for it treats of our own earth, of its birth, rise, progress and the present state. Properly studied, it embodies the complete story of life, the great history of creation, the narrative of our very existence, the record of our own planet, our present home. To be a competent geologist, one must study everything useful and economical to explain causes and effects, reasons and results. As he journeys he involuntarily studies thoroughly the country he passes through—the botany, entomology, chemistry, zoology, mineralogy, and compares them with the silent wonders he saw sculptured in the rock that lived, flourished and died thousands of years ago. Astronomy is consulted as to the formation of this earth and its companions and visitors. From the little diatom, resplendent under microscope, to the huge reptiles 75 feet long, in stony silence petrified, the boundless, natural realm of mysteries opens wide its gates. All have a wonderful tale to tell—a story often beyond the grasp of man's puny intellect. But proofs are constantly carried around with you of the uses of mineralogy and geology. The metal buttons on your clothes, the knife in your pocket, your keys, not to mention the countless array of hardware everywhere, owe their cheapness to work of the persevering follower of science. This assertion is true. It cannot be denied. There are belts and lodes of mineral in the earth that have certain limits, sure and certain manner of occurrence and regular deposition. Here the mineralogist and geologist steps in and defines them, toiling away until the rocks tell their own story of hidden treasure. By deductions, the geologist locates mineral belts, natural gas, oil, marble and minerals. It is not to be forgotten that his theories have to be tried in the crucible of experience.

LIFE SAVING BY ELECTRICITY.—A most interesting apparatus was exhibited at the last meeting of the Frankfort Electrical Society. This was a poison cupboard invented by Mr. E. G. Kubler, of Akron, Ohio, and provided with an electric safety contrivance rendering impossible on the part of the chemist any error in the sale of poisons. The cupboard, which is well executed from an artistic point of view, shows a number of compartments closed by shutters and each containing a bottle. The current is supplied by two Leclanche elements, the conductors being so arranged that they run past each compartment, terminating finally in the armature of a relay. This armature in a state of rest closes the line, going from the positive pole to a plug cord. The negative pole is connected with a spring having a hole at its end, so that, when the plug is inserted in the hole, the current is closed. The current further passes through a number of electromagnets, one being contained in each compartment, and provided with a hook, which holds up the shutter closing the compartment. On the current being closed, the shutter is released and drops. The poison bottles in the compartments stand on hubs and are provided at the bottom with matrices. Beneath the hub is a second wire, which is held down by the weight of the flask, and which on the weight being taken off interrupts the current and causes a bell to ring. It will be clear from this description that, both when a shutter is opened and when a bottle is taken out, the current is interrupted and no other shutter can be opened until the preceding one has been closed and the bottle restored to its place. By this contrivance an error is excluded with absolute certainty.—Electricity.

OIL FUEL ON LOCOMOTIVES.—The latest engine fitted with liquid fuel on the Great Eastern Railway, says a correspondent of the *Colliery Engineer*, is one of a class of ten similar express engines, and, as compared with the other nine engines doing the same round of duty, the oil burner has used about one-third the weight of coal per mile, and about as much oil as coal in weight. Her total fuel is thus about two-thirds by weight what it would be if all coal. The liquid practically gives an efficiency of double its weight of coal. The writer has had runs on this engine when burning mixtures of plain gas tar and creosote residuals, warmed up, in the tank which is placed at

the rear of the tender, to a liquidity sufficient to cause it to flow freely through the injector pipes, and to destroy its viscosity so that it would spray finely from the nozzles. Its behavior in the furnace is satisfactory, filling the firebox with white flame, while the air rings admitted of the most delicate adjustment of the supply of air to effect perfect combustion without air excess. Steam was made most freely.

A FLOATING WAVE-STILLING NET. Much interest is at present being manifested in an invention which has been submitted to the French Salvage Society by one Baron d'Allesandro. It consists in covering the surface of the sea with a specially prepared incombustible and imputrescible thin netting. This reticular fabric does not rise sensibly above the surface, and does not offer resistance to the wind; and it plays, it is claimed, the part of a bed of oil in that it has the effect of stilling the waves and rendering navigation safer and less difficult. Baron Alessandro's idea is born of the circumstance that sailors have frequently observed the calm produced by the floating seaweed technically known as *filum*, which is met with in various parts of the North sea. His netting is said to imitate exactly the nature and characteristics of this marine plant of the *Algæ* class. Experiments with the new wave-stiller have been conducted outside the breakwaters of the Quiberon Peninsula. A netting one thousand yards square, with a mesh of five centimeters, and edged with a strong bolt rope, was used; and the results obtained are stated to have been so satisfactory that the French Minister of Marine has appointed a special commission to investigate and report on the invention. *Iron*.

HIGH-PRESSURE STEAM AND INCORUSTATION.—A dangerous form of incrustation has followed the introduction of high-pressure steam. This scale is composed of fatty acids and unsaponified oils, derived from the oils used to lubricate the cylinder of the engine. These elements were communicated to the feed water when the exhaust steam from a noncondensing engine was used to heat the feed, or where the feed was drawn from the hot well of a condensing engine. The deposit was an effective nonconductor of heat, and was a most frequent cause of overheating and consequent collapse of the boiler. The substitution of a good mineral oil, with a boiling point well above the temperature of the steam, instead of the animal and vegetable oils frequently used in cylinders, was the best safeguard against the production of that very injurious form of boiler scale.—Boston Journal of Commerce.

SMOKE-PASSAGE EXPLOSIONS.—Explosions in the smoke passages of a boiler are sometimes experienced, and frequently these explosions are hard enough to tear out some of the brickwork. Explosions of this kind are caused by an accumulation of gas mixed with twice its volume of air in the smoke passages, while the damper is closed. An inspection of the boiler setting will show that there is a depression in the up-take or smoke flue leading to the chimney, allowing some of the gas generated from fresh coal in the furnace to collect in the highest part of the smoke passage before the depression is reached. In fact, the gas is trapped therein, and is held there until the damper is opened, or until the gas is ignited from the furnace. Then an explosion more or less violent takes place, perhaps doing damage to the brickwork and never doing any good to the boiler.—Tradesman.

THE latest reported aluminum-producing company is the American Aluminum Co. of Philadelphia, which proposes to produce aluminum by a process devised by Edward C. Broadwell, at a cost of 35 cents per pound. The inventor claims to be able to extract the impurities from clay and use it as his raw material.

ELECTRIC welding of street railway rails, as a substitute for fish plates, has been the subject of experiment for some time. The tests are said to prove that the necessity for joints to allow the expansion or contraction is not apparent as was believed.

GALLIUM melts at 86° F., or less than the heat of the hand. When once melted, it remains fluid even if cooled far below this temperature; but if touched with a piece of the solid metal, it solidifies at once.

SMOKELESS powder has been decided upon by the United States ordnance officials for use in both small arms and heavy ordnance.

NITRO-JUTE is a new explosive formed by treating jute with 15 times its weight of the usual nitric and sulphuric acid mixture.

ELECTRICITY.

Is Electricity a Manufactured Article?

If electricity is a manufactured article, so is the atmospheric air we breathe, and one is quite as much open to taxation as the other. Atmospheric air is utilized in various ways. Take one, for example, viz.—blast furnaces. The air which surrounds this globe of ours, and without which active natural life (animal or vegetable) cannot exist, is drawn by the blast engine into its cylinders, and there compressed and forced out through the tuyeres into the furnace with the force required to raise its contents to melting heat; it undergoes no chemical or other change; it is not manufactured by a combination of other elements; it is certainly a combination of gases, but that combination is not the result of human agency, and it is free to all creation; consequently cannot by any laws or possible course of reasoning be brought under the head of a manufactured article.

In its utilization for the above-mentioned and for hundreds of other purposes, it undergoes no change of any description, and cannot be placed in the same category as gas. Electricity is an element similar to atmospheric air. Every one who knows anything about electricity knows that it pervades everything in the universe, in a positive or negative state, and by disturbing the equilibrium which if left to itself maintains, certain effects are produced. Electrical machines, of whatever description, do not manufacture the electrical fluid. They are merely suitable forms of machines for collecting or generating (though it is a question whether the latter is a strictly correct term) the electric fluid which already exists; just as the blowing cylinder of the blast engine draws in and compresses the air, so the dynamo draws off from the surrounding earth its supply of electricity, which by careful insulation is utilized in its efforts to return to its natural condition.

Blast is conveyed by pipes from the blowing cylinder, and air vessels (when they are used) to the furnaces or to whatever other use the compressed air is to be applied. The electric current is conveyed by insulated wires and cables to whatever use it is to be applied, but man did not make the air or the electric fluid but he does make the gas, because by a mechanical process he produces it from a substance—coal—which undergoes a change and yields other substances besides gas. Neither the atmospheric air or the electric fluid undergo any change in their constituents by utilizing the energy collected, and stored in the appliances and apparatus in use at electric lighting stations, or at the blast furnaces of iron companies, and the latter could not reasonably be taxed for the supply of air drawn from nature any more than the electric fluid which is also drawn from nature.

Water works companies do not manufacture the water which they supply to the public, but all three industries derive pecuniary profit from the supply of these articles to the public, with which articles they are supplied by nature, and consequently to determine the point mooted in your article it is for legislators to decide whether setting aside the nature and description of article (atmospheric air, electricity, or water), the industry itself as a profit-producing business, taken from the same aspect as any other profit-producing business in which capital is invested, is or is not liable to taxation on the profits of the concern; if it is not taxed the chances are the public will not be supplied a whit cheaper, and if it is taxed the public will indirectly pay the tariff.—W. D. Baylis in *Discovery*.

An electric device for clearing a track of obstructions is among the newest ideas. It consists of a triangular steel folding frame over which a net is stretched. This is placed on the front of a locomotive and can be opened at will, catching the obstructions upon it. An additional arrangement is a scoop to drop on the track. The recent tests were very satisfactory.

ELECTRICITY is in successful use at the gun factory at St. Etienne, France, for tempering gun springs. The latter consists of steel wire which is wound spirally, and a current of 45 volts and 23 amperes is passed through it. When the required temperature is reached the current is interrupted and the spring falls into water. One workman can temper 2400 springs per day by this method.

THIS year's appropriation for Chicago street lighting is causing the city officers some close figuring. It costs \$56,000 to operate the South Side electric light plants. Comptroller May says that he has only \$50,000 available for that purpose.

ELECTRICAL ACTION OF THE HUMAN BODY.—In the course of a series of lectures delivered by Prof. McKendrick before the Royal Institution of London, the speaker showed some interesting experiments to demonstrate that there was in reality a distinct electrical action of the human body. He showed the effect of animal electrical currents by means of a very sensitive galvanometer. Current from animals such as the torpedo fish had long been known, he said, but it was much disputed whether there was such a thing as an electric current from man. This man-current he demonstrated by putting his hands into a three-quarter per cent solution of common salt contained in two flat vulcanite dishes. The effect upon the galvanometer was greater as the number of fingers inserted was increased, and was greatest when the muscles of the arm were contracted. There were no fewer than 50 species of animals that were living electric batteries, the speaker declared, although only five or six were generally known.

NIAGARA ELECTRIC SCHEME.—George Forbes, M. A., the world-renowned electrical engineer and expert of London, has arrived at Niagara Falls to inspect the Canadian side of the river relative to constructing a gigantic tunnel to produce electrical transmission to large manufacturing centers. Prof. Forbes was one of the competitors in the International Niagara competition in London last year, and presented a plan for transmission of electrical power to Buffalo from the falls by the use of an alternating current, which plan has commanded the attention of the electrical world. It is the intention of a Canadian company to develop electrical or pneumatic power by means of the tunnel. To show how much cheaper this power can be produced on the Canadian side as compared with the American, it is roughly estimated that a tunnel 800 feet in length over there will produce as much power as the American tunnel 7000 feet long.

THE longest distance to which electrical power is actually transmitted for electric lighting in the United States is about 13 miles. A plant of several thousand incandescent lamps in Portland, Oregon, is supplied with current for generators at the falls of the Willamette river. An alternating current of 5000 volts potential is employed. Quite recently it is reported that the Westinghouse Co. of Pittsburgh, which designed and erected the Portland plant, has contracted for another one at Pomona, in Southern California, in which about 1000-horse power is to be conveyed 15 miles, at a pressure of 10,000 volts. This plant, if successful, and there appears no reason why it should not be, will constitute a notable achievement in electrodynamics.

A LONG SPAN TELEPHONE WIRE.—A subscriber who has read the note in the issue of the *Electrical World* of April 9th about the 2400-foot span across the River Dart in England, calls attention to two telephone lines which cross the Ohio river between Portsmouth, O., and South Portsmouth, Ky., connecting the latter city with the Portsmouth telephone exchange. The wires at this point span the river from the pole on the Ohio side, measuring 102 feet above ground, to the Kentucky hills on the opposite side, the distance being 3773 feet between poles. The wire is made of steel and its size is No. 12 gauge.

MR. H. J. WELLS, superintendent of the Osceola Light Company, Osceola, Pa., reports that a Sawyer-Man lamp on one of the circuits of that company has just closed a remarkable record. The lamp in question was constructed for a pressure of 110 volts, and was run as nearly as possible at that voltage. Its normal brilliancy was 32-candle power. The lamp was placed in circuit February 22, 1890, and remained in service with an average use of 8½ hours per day until March 5, 1892.

THE Chicago Telephone Company was given permission by the City Council to put electric conduits under the streets and alleys of the city. For this and the right to string wires on poles the company paid into the city treasury during 1891 the sum of \$26,255.67, being 3 per cent on the gross receipts.

A GREAT feat in the electrical transmission of power is to be undertaken in Southern California, where a contract has been closed for transmitting 1000-horse power a distance of 15 to 30 miles in the neighborhood of Pomona.

Two Swedish astronomers, Lemstrom and Trumbolt, are reported to have produced artificial auroras by means of a network of electric currents between two mountains.

GOOD HEALTH.

Night Air and Malaria.

"Ever since I can remember, I've heard changes rung on the necessity for sitting in doors at night, especially in malarial districts. To walk about much in the evening was deadly. To sit on the porch or door step was to take one's life in one's hands, while riding or driving were only permitted as matters of necessity, and the team generally went home against time, in order to get us in out of the night air.

Now, the physician comes in here and attends a patient suffering from a malarial disease, and after divers and sundry other directions, tells us, that, whatever we do, we must not shut fresh air out of the sick-room, even at night, but must have the windows so arranged that the ventilation will be as nearly perfect as possible.

Now, this is a malarial locality, at all events it is considered so, and the patient contracted whatever disease there may be, just here. If you will tell me what difference there is between breathing night air indoors, and night air out of doors, it will relieve my mind of great anxiety. We would no more think of spending the night, or any portion of it, in the hammock on the porch than we would of seeking suicide in any other direction, and yet here is this medical authority insisting that we bring indoors the very elements that we are supposed to stay in the house in order to avoid.

Now, don't understand that I am quarreling with anybody's notion on the importance of fresh air, for I am not, but I am trying to make up my mind why so much is said against spending a little time out of doors in the evening, and so much in favor of bringing the same atmosphere into the house. For my part, I think that a great deal of the danger from night air comes from the fact that people go out without sufficient wrappings. I think that I could spend half of my evenings on the piazza, and not receive the slightest injury, if I protected myself in a proper way, but I should wear a cloak as thick as the one I use in mid-winter, and should keep a hood or light shawl over my head all of the time. I once spent a season in one of the worst malarial districts I ever knew. It was confidently predicted by every one who knew me, that I would have malaria-fever, because I insisted on sitting out on the porch of evenings, but I always put on a jacket, and then wrapped myself in a mackintosh with a hood pulled over so as to cover all but my face. I didn't catch cold, nor did I have an ache or a pain either that season or the next. Almost every one around there had ague and chills and fever and aches of all sorts, but I assure you that the sick ones were those who went out without wrappings, and always declared: "Oh, it won't hurt me to go out a little while; I never take cold," but they took the consequences of their imprudence, and some of them paid for their folly with their lives. This and similar experiences have fully satisfied me that it is less what you do than the way you do it, which preserves the health; therefore, I am going to obey the doctor's orders and open the windows, but they will not be the windows of the sick-room. I shall let in the air to the other rooms first, and ventilate entirely in what you might call a secondary fashion. I shall also take the precaution to put an extra blanket over the sufferer, or, what is often better, a very thick linen sheet, which is a more complete protection under such circumstances than the heaviest blanket."—New York Ledger.

A PURER CHLOROFORM than has yet been available, by virtue of its purity, is claimed to be produced by the Swiss scientist, Pictet, by a process of artificial refrigeration that precipitates a quantity of deleterious impurities. It is moreover claimed that the physiological effects of the impurities removed by Pictet's process when isolated have been such as to show their deleterious quality beyond doubt. If this be all as stated, the use of chloroform in surgery, the benefits of which are simply incalculable, may become free from some dangers hitherto attending its administration. The use of intense cold for purifying and separating chemical substances is still in its infancy, though for the extraction of menthol and similar substances from essential oils it has been for some years employed.

THE number of persons who approve of cremation seems to be steadily increasing. From the report of the Cremation Society of England for 1891, we learn that in 1885, the first year a crematorium was used, only three bodies were sent there; in 1886 the number was 10; in 1887, 13; in 1888, 28; in 1889, 46; in 1890, 54; and during last year, 99.

USEFUL INFORMATION.

A HEAVY experimental freight train, consisting of 40 cars loaded with 66,000 lbs., or 33 tons, of grain each, being 6000 lbs. per car over their normal capacity, was run through from Chicago to Philadelphia last week on about the usual schedule, four days time, with speeds of 15 miles per hour. The idea was to test the cars in use with a view to constructing cars of still greater capacity, and also the necessary cost of handling grain. The total paying load was 1320 tons, dead load of cars about 520 tons, of engine and tender say 80 tons, making 1920 tons. The train was handled chiefly by one engine, with an assistant engine over the heavy grade sections. According to average American experience one engine can handle a train like this on a 0.8 per cent grade (42 feet per mile).

FROM the reports and estimates prepared by the Exposition authorities for the Congressional Investigating Committee the following interesting facts, among many others, appear: To complete the Exposition and conduct it to its close will require of the Directory a total expenditure of \$22,246,403. Up to March 1st, the total expenditure was \$3,860,934. The liabilities under contracts already made are \$4,692,724. The receipts have been \$6,252,404, and the amount due from stock subscriptions and city bonds, \$5,713,051. The National Commission has expended \$184,522, and estimates that \$1,067,983 more is needed, including \$700,000 for awards. The lady managers have spent \$57,811 and think they require \$227,574 more up to the close of the fair.

DETECTING SUSPENDED ANIMATION.—A French paper reports that the microphone has been successfully used in St. Petersburg in a case of suspended animation, where the patient was given up for dead. As a last resort the physician applied a microphone to the region of the heart, and was enabled by this instrument to hear a faint beating, which proved that life was not extinct. Everything was done to resuscitate the patient, who shortly afterward recovered consciousness.

AT the mouth of Nehalem river, on the coast of Oregon, is washed ashore at high tide, a substance having the appearance of a mineral and the qualities of fine beeswax. It is also found on shore in black soil where trees are growing, at considerable elevations above the water. It is sold in Astoria at the regular price of beeswax. It belongs to the hydrocarbon series, allied to amber, a fossil remain of the resinous trees of the tertiary age.

COPPER and German silver wire .002 inch in diameter, of which it takes ten miles to weigh a pound, is used in the delicate receiving instruments for ocean cables, testing galvanometers, etc. Small as the wire is, it is wound with two layers of silk thread smaller in diameter than the wire. The wire is made by drawing through drilled diamonds.

OIL is apparently to be used instead of coal under the furnaces at the World's Columbian Exposition. The lowest offer for coal was \$2.44 per ton, while the Standard Oil Company offered oil at 70 cents per barrel of 42 gallons. It is claimed that three barrel of oil equal one ton of coal in heat-producing power.

THE usual mode of "galvanizing" iron or steel plates, wire, chains, etc., is by dipping in molten zinc. A new method, which is being introduced in England, and is said to possess advantages, is by electro-deposition of the zinc on the iron or steel from a cold solution.

A NEW method of steel making, called the "direct" process, in use at the Homestead Steel Works, Pa., is in part a trade secret. It is reported that by it a workman can make four heats to a turn, whereas, under the old method, he could make only two.

PLATINUM ore is reported discovered in the Black Hills, at a point about 25 miles west of Rapid City. The great use of the metal for electrical and chemical work make the discovery of new sources of supply a matter of much importance.

HORSESHOES of rubber set in a metal frame are said to be useful on asphalt or other smooth pavement.

THE entire number of engineering schools, so-called, in the United States is 94.

THE manufacture of nickel-steel alloy for armor plates is being extended.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Cylinder Retorts for Gold and Silver Mills, 387. Chinese Mines, 395.
 EDITORIALS.—Come to Judgment at Last; The Local Engineers; The Cyanide Process; Reception to Judge Searles; The Editors and the Mines 394.
 Sulphurets: The Mechanical Engineers Visit; Mining in Japan; A Mining Display at the State Fair, 395.
 MECHANICAL PROGRESS.—Dry-Crushing Machinery: A Wonderful Machine, 392.
 SCIENTIFIC PROGRESS.—Practical Uses of Geology; Life Saving by Electricity; Oil Fuel on Locomotives; A Floating Wave-Stilling Net; High Pressure Steam and Incrustation; Smoke-Passage Explosion, 392.
 ELECTRICITY.—Is Electricity a Manufactured Article? Electrical Action of the Human Body; Niagara Electric Scheme; A Long Span Telephone Wire, 393.
 GOOD HEALTH.—Night Atr and Malaria, 393.
 USEFUL INFORMATION.—Detecting Suspended Ammunition, 393.
 MINING SUMMARY.—From the Various Counties of California, Nevada, and other Pacific States and Territories, 390-391.
 MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 391.
 MARKET REPORTS.—Eastern and Local Metal Markets: Coal and Coke, etc., 393.
 MISCELLANEOUS.—Sale of the Minarets Mines; Welsh Tin-Plate Makers in America; The Financial Rewards of Mechanics; The Red Cedar Shingle Business; Mining in British Columbia, 388. What is a "Miner"? Mining around Black Hawk, Plumas County; A New El Dorado Reported Found; Long Cableways; Formation of Slate Rock, 389.

Come to Judgment at Last.

In the suit of W. M. Fox against the directors of the Hale & Norcross Mining Co., Judge Hebbard on Thursday rendered a decision in favor of the plaintiff for \$1,011,835 damages. He appointed a receiver to calculate the personal liability of each director, and holds each director for his proportionate share of the money taken while acting as director of the company. A conspiracy having been proven, the mill company was not entitled to any profit, and will be made to return \$2.50 per ton excessive charge.

It was a long time before this suit came to trial, but when it did, some very startling developments were made. We published the testimony during the progress of the suit.

For years the Comstock mines have been mismanaged, and this is the first time that the directors of any of the companies have been brought to judgment. The decision is rendered just as we go to press, so we have not the details. The directors did not look out for the interests of the stockholders as they did for their own, and now they must pay for it. The mill people, by connivance of the directors, got the money the stockholders should have had. It is probable that the result of this suit will clear up the moral atmosphere of Comstock mine management, and the stockholders will have a better show in the future. Mr. Fox deserves credit for his bold stand and perseverance.

THE daily papers are once more paying some attention to the mining interests, which is a good sign for the miners' cause.

The Local Engineers.

During the recent long-continued molders' strike, the foundrymen of this city were brought closely together through their association, unity of action being made necessary by force of circumstances. Only the proprietors, however, took active part in the fight.

During the recent visit of the American Society of Mechanical Engineers to this city, the local mechanical engineers and those interested in the various branches of mechanical industry were brought in friendly contact with each other and with the visitors. The effort this time was in a pleasant direction, all trying to assist in suitably entertaining the guests.

It is to be hoped that the result of this will be to form closer social relations than have formerly existed. Rivalry in business, within proper degrees, is right and proper, but it need not necessarily estrange those in different shops or works, or make them wary of each other when they meet.

The mechanical engineers here, in the various branches, should mingle with each other more than they do, and become better acquainted personally. Petty jealousies do not become men of such an earnest profession.

On the day of the trip to the big Spring Valley dam, when Geo. W. Dickie, of the Union Iron Works, was called on for a speech, he dwelt on this topic and expressed a desire to see closer relations among the local engineers. During this visit he confessed he had seen more of his professional brethren than had been the case for years, though living in the same city and engaged in the same occupations. He hoped that the visit of the society they were entertaining would result in establishing friendlier relations among the mechanical engineers of California.

When the manager of the largest industrial establishment on this coast, and one of the most experienced and skilled mechanical engineers, expresses this opinion and desire, it would seem as if others in the profession should pay heed. Isolated as they are from the great industrial centers of the East, they have a community of interest here which should be better recognized and made stronger.

It did not seem to require any very strong effort to sink individuality when entertaining the guests. Nobody wanted to take any advantage in pushing himself to the front, and all worked to a common end in making the various entertainments successful.

Personal ability is bound to find recognition in any branch, and in none less than mechanical engineering. Personal experience and knowledge are valuable to every man, but it is only the narrow-minded one who declines to impart it to others. In the engineering societies the papers read at the meetings are usually the result of labor and study in special lines, and are prepared for the benefit of others in the same branch of the profession. The men who succeed, and acquire fame, are those who spread their knowledge, not those who are wrapped up in self. Contact with skilled and experienced men is useful not only to the tyro, but to those who are also skilled and experienced.

Our local mechanical engineers have kept too much to themselves, and it is time for a change in this respect. The Technical Society of the Pacific Coast is a good center in which to gather. By joining and attending its meetings regularly, reading a paper occasionally, and having a social dinner once in a while, many pleasant acquaintances may be made and more or less information be gained as well. But whether members of this society or not, let each make up his mind to be more social with his professional brethren in the future, and it will be better for all young and old. When such men as George W. Dickie, Irving M. Scott, John

Richards, Wm. R. Eckart, James Spiers, Robert S. Moore, Patrick Noble, Herman Schussler, H. J. Small, and Marsden Manson show such a disposition as they do in this direction, all the others can well afford to join hands.

The Cyanide Process.

No metallurgical improvement of late years has attracted as much attention from the mining public as the MacArthur-Forrest process, known also as the cyanide process. It is of English origin, but the rights in this country are owned by an American company with headquarters at Denver, Col. The rights in this State and Nevada are owned by a San Francisco company. Several plants are in operation and a number more are being erected for working ores on this system.

The principal feature of the process as far as it relates to gold ores is that it treats the whole mass of ore, sulphurets and all, at one operation, whereas by the ordinary milling method the sulphurets have to be taken out and worked by another process, after the free gold has been recovered by amalgamation. The percentage secured is quite high. Outside of the usual crushing appliances no machinery is required, the process being conducted in vats or tubs.

In view of the great interest shown in this process it is our intention during the coming month to publish a special edition embodying all the obtainable information on the subject. We have already printed a great deal concerning the process and have been unable to supply the demand for copies of all the articles. We intend, therefore, to republish more or less of that which has already appeared together with certain new matter, in the special edition referred to. Mining and millmen who desire full information on this subject will do well to send in their orders for copies of the special edition, in which they will find all available information concerning the cyanide process.

The Editors and the Mines.

The visiting editors go this week to Dutch Flat, where they will be shown the systems of gravel mining, including that by the hydraulic process, and will then go to Grass Valley and Nevada City to see the quartz mines and mills.

This is the first time that any body of visitors to California have been taken to the mines. They are shown all our other industries but the mines have been neglected. For once, however, the honest miner is not forgotten, and the visitors will be shown something they will remember better than the orange groves, orchards and gardens of the State. They can see some of these things at home, but have no opportunity to see an immense stream of water tearing down the gravel to set the gold free. They will be shown how the miners live and work and how the gold they all yearn for is obtained.

This instructive object lesson will do them all good, and doubtless they will all write more or less about it, so it may result in good to us of California as well.

In his official report of the operations in the Consolidated California and Virginia mine for the present week, and also in his weekly reports in the future, Superintendent Lyman, acting under instructions from the home office, gives the average assay value of the railroad car samples of the ore extracted and sent to the mill, as well as the average battery assay value of the ore mined during the week.

THE California Miners' Association Committee to accompany the National Editorial Association party to Dutch Flat and Grass Valley, consists of Messrs. Jacob Neff, S. K. Thornton, W. O. Ralston, Henry Martin, H. W. Meade and Charles G. Yale (of the MINING AND SCIENTIFIC PRESS).

Reception to Judge Searles.

Judge Niles Searles, chairman of the delegation sent to Washington to the California Miners Association, to advocate the miners cause before Congress was given a public reception at Nevada City on Monday. The people of the whole county joined in the demonstration, which was a hearty cordial welcome. Hydraulic Parlor, Native Sons of the Golden West acted as escort to the theatre where the reception took place. The stage had been nicely decorated by the Native Daughters with stands of the choicest flowers. Resting upon an easel was a large oil painting of Judge Searles, and above the centre of the platform was suspended the beautiful banner of Hydraulic Parlor, having for a background two large American flags. On the right of the stage was a hydraulic monitor.

Fred E. Brown, President of Hydraulic Parlor, called the meeting to order, which opened with music by the band, followed by a chorus, "By the Seaside," by the choir, under the direction of John Werry.

The Secretary, John C. Nilon, read off the list of vice-presidents, the gentleman named being invited to seats upon the platform. Major J. S. McBride of North San Juan was then introduced as chairman of the meeting. The Major very neatly acknowledged the honor conferred upon him, and in setting forth the object of the meeting made a good speech. Upon the conclusion of his remarks Frank T. Nilon, the District Attorney, was introduced and delivered the address of welcome.

In responding, Judge Searles expressed himself as feeling greatly honored at the cordial welcome he had been given, and said that he felt that he was being too highly honored for what he had done; in other words, he felt as if he was obtaining goods under false pretenses. He gave an outline of the work performed by the miners' delegation at Washington, telling of some of the principal obstacles met with and how they were overcome, and how the way was paved for the Mining bill before its introduction in Congress. He paid a magnificent tribute to Secretary of War Elkins, saying that physically he weighed over 200 pounds and intellectually he weighed over four tons; that he could in two hours time grasp and solve a proposition that an ordinary man would take two months to consider. Secretary Elkins had treated the mining delegation very kindly, and it was through him that an appropriation was recommended. Judge Searles also gave much credit and praise to Governor Markham for the able assistance he had given the commission before their departure for Washington, and also during their sojourn in the national capital. All the other members of the commission, Hobson, McMurray, Luttrell and McLaughlin, came in for a full share of credit for what had been done, and Senator Felton and Congressman Caminetti each received from the speaker their measure of praise for the zealous assistance they had given in promoting the cause of the miners. Judge Searles gave it as his opinion that if the bill for the construction of restraining dams was not passed at this session of Congress he believed it surely would be at the next session. In concluding his remarks the Judge said that he intended to make Nevada City his home during the remainder of his days. He had been a resident of the county forty-three years and had always labored for its best interests, and always would. He thanked the people for what they had done for him and for the very kind manner in which they had shown their appreciation of his efforts at Washington.

THE BRANCH LINE of the Oakland Consolidated Company's electric road to the Sixteenth-street depot was opened Monday for regular traffic. It connects with the main road at Sixteenth and Grove streets.

A Mining Display at the State Fair.

The State Board of Agriculture met this week with the Citizen's Industrial Association of Sacramento, to arrange matters in connection with the coming State Fair. Among other things they intend to form an extensive and varied State exhibit of minerals, quartz, agate, building stone; etc.

In the formation of this exhibit the aid of William Irelan and the State Mining Bureau will be asked, and as they have at all times showed their willingness to take hold of and complete an exhibit of this character, it is expected that this will be a strong feature in this year's exposition.

There is also to be a mining display. The space to be allotted this exhibit of one of California's principal resources will be the entire northeast court, embracing an open area of 160 feet square, or 25,900 square feet, wherein it is proposed to show as far as possible, the mining industry, from the taking of the crude rock from its natural bed, and its passage through crushers, amalgamators, stamp mills and all other machinery and paraphernalia used in the extraction of gold and silver.

The State Board named the following Committee on Consultation with reference to said committee: Chris Green, representing the board; Messrs. Lubin, Steffens, Van Voorhies, Coleman and Hall from the Industrial Association, and Hon. J. A. Filcher of Placer, Hon. J. H. Neff and Chas. H. Mitchell of Nevada.

It being understood that most of this committee would be in Nevada City on Saturday of this week, it was suggested that a meeting be then held for the furtherance of this important matter.

The State Board has from time to time contemplated an exhibit of this character, as they believe it due to the mining interest that a full exhibit of this industry be made this year as a preliminary of the great exhibit to be made in 1893 at Chicago.

A MONSTER CABLE.—The largest wire rope ever made in this city by the California Wire Works was hauled by 60 horses up Market street, on Friday of last week, to the power-house of the Ellis street cable line. The cable was manufactured in the remarkably fast time of 52 hours, and surpasses all other undertakings of a similar nature by any wire works in the United States. The rope is 29,020 feet in length and cost the cable company in the neighborhood of \$8000. It is 1½ inches in diameter and weighs 72,830 pounds. The reel weighed 6000 pounds and the truck 30,000 pounds. The gross weight hauled by the 60 horses was 108,830 pounds. The rope is to be kept in reserve in case of an accident.

THE Butte & Boston Company, through its general manager, Captain C. H. Palmer, has negotiated the purchase of the Mountain Chief mine from Eugene D. Sullivan and Charles Nuss. The price is understood to be \$75,000, and from all reports the Butte & Boston people have acquired a good property for a low figure. The Mountain Chief lies immediately north of the Modoc, and is one of the oldest patented claims in Summit Valley district, Montana.

CŒUR D'ALENE.—Colonel Blunt of Fort Douglass has been ordered by the War Department to hold his command in readiness to march at an hour's notice to the scene of the mining troubles in the Cœur d'Alenes. The Governor of Idaho has gone to Wallace to investigate and prepare a statement for the benefit of the public.

THE Executive Committee of the California Miners' Association met on Thursday of this week to receive reports from Washington.

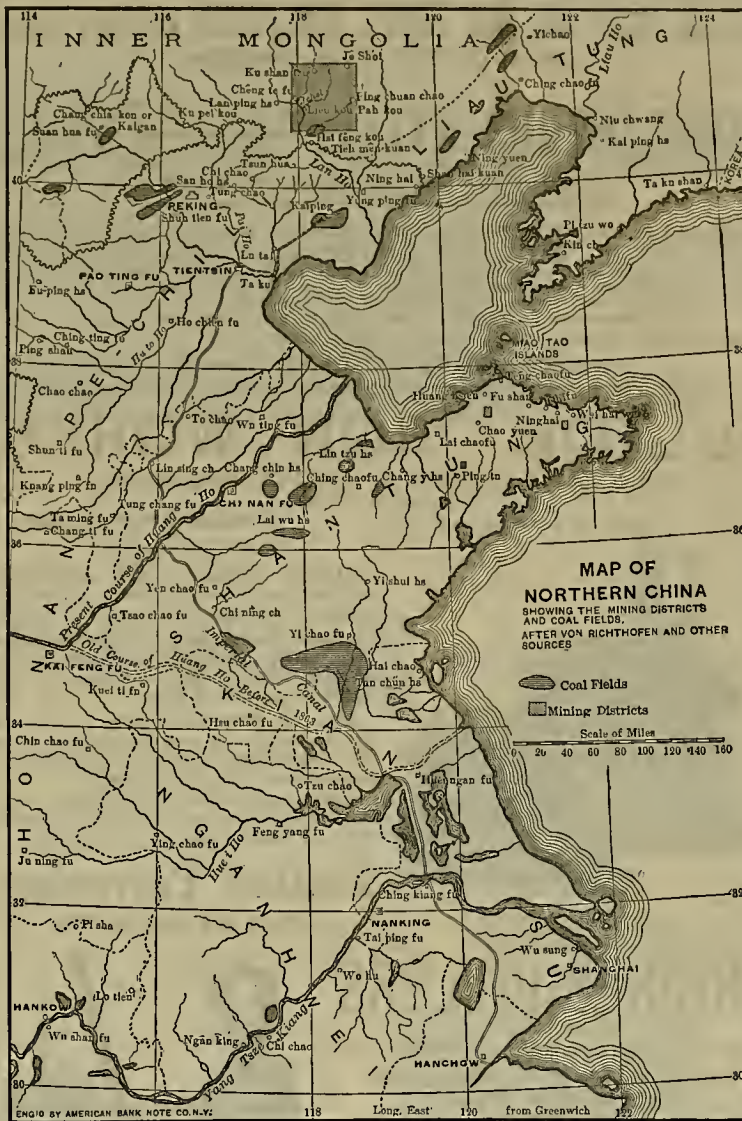

BOTH Messrs. Searles and Hobson of the miners' committee to Congress have returned home, leaving only Mr. Luttrell at Washington.

The Mechanical Engineers' Visit.

The members of the American Society of Mechanical Engineers, who have been visiting California, have started homeward. All were pleased with their visit. They especially appreciated the attention paid to them in Sacramento and San Francisco, where they had every opportunity to ex-

fact, they were left but little time to themselves, their stay here being so short. The sessions of the Society were held in the evening, the days being devoted to visiting industrial establishments and points of interest on the peninsula and about the bay.

The trips to the cable-engine houses, the Spring Valley dam, the Union Iron Works, and Pacific Rolling Mills, and the Sacra-

amine all that might interest them. The facilities placed at their disposal enabled them to see in a short time that which might have taken many days under less favorable circumstances.

The arrangements made by the local Executive Committee of the foundry and iron trades, before the arrival of the party from the East, were such as to give the visitors plenty to do in the way of sight-seeing. In

mento railroad shops, were all instructive as indicating the scope of our work here. The visits to Sutro Heights and Cliff House and the tugboat excursion around the bay and to Mare Island, were particularly enjoyed by the ladies of the party. The reception by Mrs. A. S. Hallidie, and the lunch by Mrs. James Spiers of Berkeley, were also prepared for the lady visitors.

On the last evening here, Mr. W. R.

Eckart gave a lantern exhibition, illustrating the mechanical progress of California. The slides have been presented to the Society, together with the descriptive notes.

Altogether, the visit was a success in every way. The engineers greatly appreciated the attention bestowed upon them by their brethren here, and on the evening of their last session adopted a series of resolutions, thanking by name all those persons and companies who had entertained them so pleasantly.

Mining in China.

In last week's PRESS a brief sketch was given of some of the mining districts in China, including the Ping-Tu gold district. A sketch is here given of the Ping-Tu shaft. The vein varies in width from four to ten feet, and consists of quartz mineralized in the upper levels with carbonate of iron, and in depth with pyrites, some galena and a little copper-pyrites. In two years the product of the mill, with its sixteen concentrators, amounted to 1,500 tons of concentrates, samples of which, taken from different parts of the pile, assayed from \$28.77 up to \$70.94 per ton. An average of the pile assayed in gold \$36.31; silver \$2.94; total, \$39.25 a ton. Small chlorination works furnished with one reverberatory, a chlorine generator, and two chlorinating and precipitating vats has been erected. Its daily capacity is one ton, and about 100 tons of ore have been treated; but the process at first conducted under European supervision, was not a success, as the residues contained \$26.87 in gold and \$10.70 in silver per ton, so that if the richest concentrates—sample 5 of the assay, for example—were treated, about half the precious metals would be left in the residues. It is possible that the comparative coarseness of the concentrates and the low fineness of the gold, and large proportion of silver may be responsible for this failure.

The Ping-Tu mine is probably better equipped than any other metal-mine in North China; besides the fine hoisting-works and pumping-machinery, it has an 18-inch tramway, 1,600 feet long, running to the mill, a well-appointed assay-office, with a quicksilver retort, pumping-machinery for the stamp-heads, and a ditch supplying water to the concentrators; a dynamite factory with a capacity of 600 pounds per day and a foreign two-storied house with glass windows and board floors, which is a structure rarely met with in China outside the treaty ports and missionary stations.

Deposits of ores of gold, silver, copper and lead are found at Chi-Chaw, on the Yang Tse Kiang, shown on the accompanying map; in the Shantung promontory, at Ning-Hai, Ping-Tu and Chao-Yuen; in the Ping-Chuan-Chao district, the Je-Shui district, and the Jehol district, the latter including the silver-lead mines of Yen-Tung-Shan and Ku-Shan-Tzu. Mr. Clark, who wrote the paper from which we quote, visited all these places professionally and examined the mining properties.

IRON AND STEEL.—The annual statistical report of the American Iron and Steel Association, just issued, says: "The production of pig iron in 1891 was 1,033,573 net tons less than in 1890; a decrease of 10 per cent. The production of Bessemer steel ingots was 494,428 net tons less, a decrease of 12 per cent. The production of open-hearth steel was 649,323 tons, an increase of nearly 13 per cent. The production of Bessemer steel rails was 649,759 net tons less than it was in 1890, a decrease of over 30 per cent, but the production of all rolled iron and steel other than rails was only 60,235 tons less than in 1890. The production of iron and steel-cut nails in 1891 was 638,770 kegs less than in 1890, but the production of wire nails was 978,474 kegs, and of wire rods 89,049 net tons greater than in 1890.

WATER WHEELS

BUILT BY THE **JAMES LEFFEL & CO.** WITH 30 YEARS EXPERIENCE.

UPRIGHT AND HORIZONTAL.

FOR MINING, ELECTRIC and IRRIGATING PLANTS.

Easy working gates, highest percentage of power and regular speed at all gateage. Equally adapted to high and low heads. 110 sizes and styles. Write us, give number of feet head and size of stream, state what kind of mill you have, and we will send fine pamphlet.

THE **JAMES LEFFEL & CO.,** SPRINGFIELD, OHIO, AND NEW YORK CITY.

GEN'L AGENCIES: { FRASER & CHALMERS, CHICAGO, ILLS., AND PARKE & LACY, SAN FRANCISCO, CAL.

BALDWIN LOCOMOTIVE WORKS.

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

LOCOMOTIVE ENGINES!

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable. Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

BURNHAM, WILLIAMS & CO., Proprietors, Philadelphia, Pa.

MOTIVE HERCULES Gas and Gasoline POWER ENGINES

Have fewer parts, and are therefore less likely to get out of order than any other gas or gasoline engines now built. Just light the burner, turn the wheel, and it runs all day.

MAKES NO SMELL OR DIRT.

No double or false explosions, so frequent with the unreliable spark.

For Simplicity It Beats the World.

It Oils Itself Automatically.

No Batteries or Electric Spark.

It runs with a Cheaper Grade of Gasoline than any other Engine.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, May 26, 1892.

General trade continues fair. The weather still has considerable influence on trade, but so far it has been favorable. If in the month of June the weather continues favorable for crops, then we can reasonably look for prosperous times the remainder of the year, notwithstanding that this is a presidential election year. At the East general trade is reported dull, owing to adverse weather and only fair crop prospects. In the local market, money continues in liberal supply, yet only regular customers and persons offering undoubted security are able to get accommodations. There is no call for funds for speculative purposes, and a very light call for legitimate trade or business requirements. It is claimed that when new crop grain begins to move that there will be an active call for money, yet the bulk of requirements will be met by interior capitalists and bankers.

Eastern and European mail advices report money very easy at low rates of interest. There is an almost total absence of any speculative movements, while trade and general business continue to run in the rut into which they have been working for some time past. New York mail advices report an increasing demand for investments and not speculative security. The former are said to be scarce.

SILVER.—The market for silver continues to be an anomaly. The statistical position of the metal ought to send prices up, but then it does not. The markets are very sensitive, for when any news comes in, prices advance, but with this news, prices fall back. It looks very much as if the markets are manipulated to make them look as bad as possible, but whether this is being done for the purpose of concentrating leading speculative securities, whose market values are based on the price of silver, is an open question. If this is the case, then it is not at all unlikely but what we will witness much better prices before the year passes. Everything nowadays appears to be a gamble. This condition is largely instrumental in producing metallic accidents, and the retiring of men of brains and business sagacity. The silver market in this country is passing through the throes of uncertainty, made so by moneyed and also political combinations. Whether a more stable market value will be given to the metal remains to be seen, but it now seems more than probable that such a desideratum will be attained. Silver leagues are being formed in Colorado, South Dakota, Idaho, Washington, Montana, Oregon, Nevada and also in this State. These leagues, if they stand solid, will unquestionably control the coming presidential election. Beside silver leagues on this coast, cotton leagues will be or are being organized in the Southern States, and corn or wheat leagues in the Central States, whose aim is to promote bimetallism. With such formidable organizations working in harmony with one object in view, it is only reasonable to expect that success will crown their efforts. European mail advices are more encouraging for bimetallists. It now looks as if an international conference will be held to discuss and, if possible, to arrive at a favorable conclusion on the silver problem.

MEXICAN DOLLARS.—The market is firm at around 69 1/2 cts. There is a growing conviction that the market will soon begin to improve.

BORAX.—Receipts the past week aggregate 219 cts. The market at the East is reported fairly active with more liberal supplies coming and slight concessions obtainable. Shipments overland in April aggregated 146 tons.

QUICKSILVER.—Receipts the past week aggregate 301 flasks. It is claimed that the market is easier yet we are not able to get lower quotations. Overland shipments in April aggregated 33 tons.

LIME.—Receipts the past week aggregate 3,147 bbls. The market is essentially unchanged.

FIG LEAD.—The market is said to have a stronger tone in sympathy with the East when it is claimed that the Idaho mining troubles cause a scarcity of ores in some quarters that is rather threatening, and that late accumulations of pig lead, it is reported, have been cut down considerably, so that the surroundings look favorable for a strong market.

FIG TIN.—The consumption demand in this market is only fair. On the 18th, 171 pigs were received from San Diego. Eastern mail advices continue bullish. Importations are heavy, yet prices do not go down. Shipments of Straits to England, America and the Continent, continue very light which cause a steady decrease in stocks.

FIG IRON.—The market shows increasing firmness. It should not cause surprise if an advance was established at an early day. In Great Britain the market is higher, owing to lighter stocks, while at the East increasing business is very generally reported. Well-informed Eastern writers claim that bottom prices have been touched. Agricultural implement makers are not buying much finished iron and steel, owing to unfavorable crop prospects, which exert an unfavorable influence on pig.

COPPER.—The market is steady, but firm. Overland shipments in April aggregated 32 tons of copper cement from Stockton. The expected decline at the East on the opening of lake navigation did not materialize. Owing to heavy shipments by "rail" in the winter months, there was very little copper for shipment when lake navigation was resumed. London cables the *Iron Age* of May 19th report as follows: "Copper is firmer. During the latter portion of the week, there has been more speculative and freer purchases for consumption, which, together with favorable advices from America and more inquiry from the continent, restores confidence."

COAL.—Imports the past week aggregate as follows: Liverpool, 1522 tons; Departure Bay, 3649; Sydney, 2270; Nanaimo, 7355; Tacoma, 14400. Total, 19,196 tons. The market is reported unchanged. Continued favorable crop weather causes dealers to act with caution and not anticipate wants to any great extent unless offered inducements. Unless the weather in June should be unfavorable to growing wheat, we can reasonably expect a large addition to the coal fleet bound for this port for wheat cargoes.

Eastern Metal Markets.

New York, May 26.—The following are the closing prices the past week:

	Silver in London	Silver in New York	Copper	Lead	Tin
Thursday.....	40 3-16	87 1/2	11 95	4 2 1/2	21 10
Friday.....	40 1/2	88	11 95	4 2 1/2	21 10
Saturday.....	40 1/2	88 1/2	11 95	4 2 1/2	21 10
Monday.....	40 1/2	87 1/2	11 95	4 2 1/2	21 10
Tuesday.....	40 1/2	87 1/2	11 95	4 2 1/2	21 10
Wednesday.....	40 1/2	87 1/2	11 95	4 2 1/2	21 10

Quicksilver is easy. Borax is in liberal supply and easier. Pig tin is very strong under manipulation. Pig iron is barely steady. Copper is firm but not quotable higher. Lead is quiet but steady.

THE BLASDEL
CONCENTRATING BELT COMPANY.

We have now made arrangements to have
our new Improved Concentrating Belt manu-
factured in San Francisco. We keep always
on hand Belts suitable for the Triumph and
Frue machines, but can make any length or
width desired. The advantage of these belts over
any others will be readily seen by practical millmen.
First, the flanges or edges of our belt stand at an acute
angle inclining toward the center, and therefore readily
conform to the change of direction while passing over
the end rollers; thus the vexation and loss caused by the
frequent breaking of the flanges of the old style belt is
practically done away with. Again, our holts, at intervals
of two to four feet, have a very slight rifled surface for the
space of three inches, which tends to equalize the pulp
on the belt, and prevents it from banking on the sides and
forming channels through the center. These slight rifles
also save very fine sulphurets and the quicksilver that
would otherwise escape with the tailings from a belt,
the surface of which is entirely smooth. We can safely
say that it is a better belt than has ever been manu-
factured for use on this coast. It will last much longer
and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets
H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. Address **ROWELL'S ADVERTISING BUREAU, 108 Spruce St., N. Y.** If you wish to advertise anything anywhere at any time write to **GEO. P. ROWELL & CO., No. 10, Spruce St., New York.**

F. A. HUNTINGTON, PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mill; It is simple in construction, and while in motion can be easily adjusted to feed fast or slow; It has but few wearing parts and its positive movement make it the best Ore Feeder now in use.

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

THE PELTON
SYSTEM OF
POWER

THE PELTON WATER WHEEL.

The most distinctively new and important development relating to hydraulic power that has been made in the last half century. Adapted to all conditions and every variety of service where a head of 20 feet or more can be obtained.

OVER 2500 IN USE, AGGREGATING NEARLY 300,000 H. P. Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 to 2000 or more feet. Much better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC POWER TRANSMISSION. The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. **SEND FOR CATALOGUE.**

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, varying from the fraction of 1 up to 100-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. **SEND FOR MOTOR CIRCULAR.** Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates. The great success that has attended the introduction and operation of the Pelton Water Wheel has led to many imitations and some infringements of the various patents of this company. Intending purchasers are hereby warned that all such infringements will be vigorously prosecuted, and that the users of wheels so infringing, as well as the manufacturers, will be held equally responsible.

THE GATES ORE AND ROCK BREAKER.

Unlimited in Capacity; Unequalled in efficiency. **UPWARD OF 3000 NOW IN USE.** Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without additional expense. Best and only Crusher adapted to Macadam Road Work. **Send for Circular.**

 " 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodhull" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
 I am, my Dear Sirs, Yours faithfully,
 S. HARRIS, Manager.

Hydraulic Mining in Trinity County.

In the northwestern part of California, where the rivers are not navigable and do not pass to the ocean through agricultural land, hydraulic mining is carried on without interference of farmers or courts. There is no trouble with the debris in Trinity or Siskiyou counties, as the tributary streams in which the mines lie, drain into the Klamath, a nonnavigable river emptying into the ocean. In the past few years more attention has been paid to gravel mining in these counties, and the region is quite prosperous.

One of the best equipped hydraulic mines in the State is in Trinity county. This is the Red Hill, which is a paying institution regularly every year. The claim has all the best of appliances, an abundant water supply, and gravel enough to work on for many a year to come. They have their own sawmill for lumber, and there are good accommodations in the way of buildings, barns, stables, etc. The mine has long since paid for itself, and it is expected to take out at least \$100,000 this year.

We have reproduced from photographs made by E. H. Benjamin, son of the manager of the mine, a few characteristic features of this claim. One of the nozzles shown is the largest in the State, a 9-inch one. The smaller, 6-inch nozzle, under the pressure of 500 feet, will discharge 1375 miners' inches of water (15,500 gallons) per minute, at a velocity of 175 feet per second. This means about one ton of water each second hurled against the bank with a velocity of two miles a minute. This stream is capable of exciting a force of six tons, and doing an amount of work nearly equal to 2000-horse power. With the 9-inch nozzle proportionately greater results are obtained.

The Hayes Red Hill mine, owned by Dr. A. H. Hayes of Boston, is in Junction City Mining District, Trinity County, at the junction of Trinity river and Canyon creek.

It comprises some 1100 acres of mining land. The bank of the low bar runs from 25 to 150 feet, and on the upper bar from 100 to 200 feet in depth. It was originally opened as a drift mine a number of years ago, but the claim was very rocky indeed, and in 1872 Mr. E. M. Benjamin, the present general manager and superintendent, went up there to bring in the water from the head of Canyon creek. He built a ditch and flume some nine miles long, with a

cables are five inches in diameter, made of 1050 strands of No. 10 Bessemer steel wire. The cables weigh 11 tons each, and had to be made on the ground, because they could not be carried over the mountains. The towers for the cables are made of hewn timbers of sugar pine. The bridge is 34 feet above what is known as high-water mark, and stood the big winter when all the other bridges in the region went out. This bridge alone cost \$36,000.

Even the brief statements made will show that considerable capital must be invested in a fully equipped hydraulic mine to work it properly. The water supply must be abundant, and the reservoirs, ditches, flumes, etc., necessary to bring it to the mine are very expensive.

Hundreds of mines similar to this are lying idle in California to-day, awaiting the action of Congress to permit them again to work without injury to other interests.

This can only be done by building dams to keep the debris back in the canyons and away from the rivers. The miners are willing to build these dams, but unless built with the sanction of Congress, the miners are liable to injunction by any one who may bring suit for injuries inflicted by the debris or tailings.

WORK has been commenced on another electric road in this city—that of the Omnibus Cable Co. The Omnibus Company announces that its horse car line from the Third and Townsend railroad depot along Third, Montgomery, Pacific and Stockton to North Beach will be converted into an electric line. What the company declares to be the beginning of the change was made this week when a gang of about twenty-five men, under Foreman Scott, was put to work.

SCENES ON A TRINITY COUNTY HYDRAULIC MINE.

capacity of 2000 miners' inches. In order to get the pipe onto the claim, it was brought across the Trinity river on a suspension bridge. The largest pipe that comes from the pressure tank down to the bridge is 22 inches in diameter, and runs into an 18-inch pipe. On the claim are six Giants, two of them nine inches in diameter, one of seven, one six, one five, and one four.

At this mine they strip from six to ten acres of bedrock a year. The gold obtained is coarse, cucumber-seed gold. The bridge for bringing the pipe across the river was built under considerable difficulty. It is 350 feet span, with a 12-foot pressure. The

The bed-rock ditch on the high bar is 45 feet deep. The cut is 1344 feet long from the dump to the head of the ditch. The engraving gives a good view of this bed-rock ditch and flume.

The big nine-inch nozzle shown in the engraving is one of the largest size made. The fall is about 500 feet. On the high bar or bench the working pressure of the nozzles is 430 feet. The other nozzle shown in the engraving is a six-inch Hoskin. This and the larger one were made by the Joshua Hendy Works in this city. The flumes are four-foot ones. The mine dumps into the Trinity river, which dumps into the Klamath, and thence to the ocean.

The prospects for the Mining bill continue favorable. Mr. Geary has had a conference with Holman, and the autocrat from Indiana promised to give a definite answer concerning the amount that would be allowed within three days. The resolutions of the Fresno convention have had a good effect.

ELECTRIC ROAD EXTENSION.—Preparations are being made for the extension of the new electric road from Holy Cross Cemetery to Baden, and the iron is already on the ground. This will mean 22 miles built by the company, all that it will construct until the new power-house is built.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—ED.

The Mining Region East of the Sierra.

Some of the Borax Deposits.

SAN FRANCISCO, May 28, 1892.

TO THE EDITOR:—By reason of the State Printer requiring the manuscript of the State Mineralogist to be in hand much earlier than usual, the last report of this official contains less information about the mining districts lying east of the Sierra Nevada than it otherwise would have done, this being especially true of Inyo and Mono counties. While the business of mining has for several years past been greatly depressed throughout these counties, rendering such lack of information the less important, it is still the case that this Trans-Sierra portion of the State abounds with mineral wealth of almost every kind, deposits of gold, silver, lead, copper, salt, soda, borax and iron being very common. What militates most against the progress of this country is costly transportation, coupled with scant supply of wood and water, there being here few running streams and no lumber forests, except such as grow along the easterly slope of the Sierra Nevada, a combination of disadvantages aggravated just now by the prevailing low price of silver.

SALINE VALLEY.

In this valley, which consists of a broad, deep depression lying between the two principal ridges of the Inyo range, is found the only borax deposit of any magnitude in Inyo county. Seen from the summit of the mountain on either hand, this valley presents the most desolate and forbidding appearance imaginable, its entire surface being composed of white and glistening deposits of salt and soda, or barren sage lands, on which there grow nothing but a few wild and bitter shrubs, with here and there a mesquite tree, piñon and juniper growing sparsely on the mountains adjacent. There is here but little grass or other useful herbage, few springs and no running water. The sand driven by the wind, drifts into heaps and cuts like hail. Although the summers are hot, the winters here are not extremely cold. While the rainfall is limited, much snow falls on the higher mountains.

The principal borax deposit in this valley, so far as actual production goes, is owned by Conn & Trudo, who make at the works on this marsh about half a million pounds of the refined article annually. This product is hauled by large teams, across the mountain, 45 miles to Alford on the Carson and Colorado Railroad, over which and connecting roads it is shipped to New York and other eastern markets.

The Stoutenborough Co., having put up here a refinery of limited capacity, lately commenced operating the same, with every prospect of making the enterprise a success, as their superintendent, H. W. Barton, has had much experience at the business and the company's deposit is inexhaustible.

Several other parties own large tracts of the principle saline here, but none of them have as yet utilized much of the crude material, though it is probable that they will in good time do so, as portions of their ground are rich in boracic acid. On the claims of Messrs Cox & Lent the mineral-bearing crust is very heavy, attaining in places, the usual thickness of three and a half feet, a great deal of it being over two feet thick.

Just over the southern boundary of Inyo, in San Bernardino county is situated

THE SEARLES' BORAX MARSH.

One of the most extensive, largely productive, well equipped and ably managed of all the salines found in either California or Nevada, the only countries in which this salt is produced in large quantities on the Western Continent. The deposit here occupies a vast mountain girt basin similar in all respects to Saline Valley.

The Searles' refinery, very complete as well as extensive, is capable of turning out 150 tons of refined borax per month, though, owing to an understanding among the several producers, it is not being run to full capacity. There is employed here, a working force of 40 men, 50 large draft mules being used for hauling the manufactured product to Mojave station, 75 miles distant on the Southern Pacific Railroad. Twenty of these animals constitute a team. Fifteen tons placed on two large wagons coupled together, make a load, and a pretty good one, there being mountains to cross, also long stretches of deep sand. Returning, these teams bring back supplies, including crude petroleum, this being the fuel here used for generating steam. Formerly, sagebrush

and greasewood were employed for this purpose, which practice was kept up until the country for many miles around was completely stripped of these shrubs, making the distance, they required to be hauled, so great, that crude petroleum transported more than 200 miles, 75 on wagons, was found to be the cheaper fuel.

Nowhere throughout the great Mojave desert, of which this region forms a part, do we find any lumber trees except on the Sierra Nevada, which borders it on the west, and in the Kingston range, standing far to the east. On some of the other mountains, not all, however, a sparse growth of scrubby pine and juniper is met with; there being elsewhere scarcely a tree, large or small, to be seen. Along Owen's river and the Mojave, there grew once a narrow fringe of cottonwoods, now all cut away.

Water for the Searles' establishment is brought from a group of springs seven miles off in the Argus mountains, being conveyed through iron pipes and delivered under a pressure of 1000 feet. This water which is pure and soft, is used for feeding the boilers and for domestic purposes, that required for the refinery being obtained by boring on the border of the marsh to a depth of 55 feet. Including the reduction plant, the hoarding and lodging houses, the shops, barns, corrals, etc., quite a village has been built up here in the wilderness. This property, which, everything included, has cost a large sum of money, is now valued at \$1,000,000. It belongs to the San Bernardino Borax Co.; John W. Searles, Manager on the ground, Henry Krehs, Jr., Financial and Commercial Agent in San Francisco.

HOW THE ORE EXTRACTED IS DISPOSED OF.

While mining is so generally depressed throughout Inyo and Mono counties, there is still a considerable population employed at this business. Along the Coso, Inyo and White Mountain ranges, between three and four hundred men are making good wages working their own claims or the claims of others on tribute. These men select from the ores extracted the richer portions, and ship them to markets and smelting works abroad, the balance being left at the mines awaiting the time when it can be profitably treated on the ground. Although there are a good many mills and smelters in that region, only a few of them, owing to the cost of fuel, are running.

Traveling through this country, one comes across a camp here and there that has a good deal of life in it. Such is

FISH SPRINGS.

A not very populous but a really prosperous quartz-mining locality, situated on the west side of Owens River valley, at a point where the Sierra Nevada mountains, receding to the west, leave here a subordinate outlying range traversed by numerous free gold-bearing quartz lodes. Two large creeks, heading in the Sierra, flow across this district, and, having a great fall, afford an almost unlimited water power. Settled here is a small community of miners, who, for working the ore from these ledges, have put up on one of these creeks several large water-driven arrastres. Running without intermission, except for cleaning up, these machines crush a good deal of ore, which yields from six to eight dollars per ton in free gold.

On my visit to this locality, I found there James McCarthy, John Daily, John Welsh and R. T. Dunlop, all men of superior intelligence, courteous to the stranger, and, after the manner of miners, given to a broad hospitality. Besides working their mines, these men cultivate, in this far off and secluded spot, a tract of land, on which they grow and mature every fruit raised in Central California. From what I saw and could learn of these Fish Spring mines, I judge there might be grouped together there a property that would form the basis for a very desirable investment.

MORE LIFE ELSEWHERE OF LATE.

Several other mining camps in this region have shown increased signs of activity during the past year or two; among these, Darwin, Cerro Gordo, Lone Pine, Benton and Bodie being conspicuous. In some of the leading mines at the latter place, the improvement made within the past year has been so marked as to encourage the hope that they will soon be restored to their former condition of large and profitable production. The trouble with these mines has been that, when in bonanza, William M. Lent and the other large owners spent all their revenues in making large dividends, and then selling out their shares at big figures, neglecting, meantime, to keep up advanced explorations. And so it happened, when the ore bodies then being worked were exhausted, the several companies, being without ore or the means for searching after further supplies, ceased taking out bullion,

the most of them until recently having for eight or ten years remained in borrasca. H. DEGROOT.

The MacArthur-Forrest (Cyanide) Process.

CALUMET MILL, MIDDLE CREEK, SHASTA CO., May 25, 1891.

TO THE EDITOR:—At first, after reading the communication of "A Practical Miner" in the PRESS, I thought it useless to reply to so sappy an article, but thinking he echoed the sentiments of some others as to new things, concluded to dot off a few lines, which may be of some general value, not caring for the uncalled-for dashes at me personally. Your correspondent says: "I do most of my scribbling on the rocks, with pick, gad and drill." Taking the lack of good sense in his present communication, I think he had better stick to his tools, until he gets better educated on more modern ways of treating ores. He says: "I, for one, will stand by the good old way—stamps, copper plates, concentrators and the chlorine process." There are others like him, who have got to travel in the same old rut, simply because they cannot see farther than the end of their nose, or think more than to get their regular meals. I well remember when chlorination was first tried in California; it proved a big failure, and laid for several years before a second trial was made; but chlorination succeeded and came to the front. I have no fight against chlorination, it is a good process, but the cyanide is going to override it, from the simple fact that for about half the cost of chlorination, as high a per cent of gold can be had, and, with the gold, a given per cent of silver, which chlorination will not save. Your correspondent further says: "They pretend we lose a whole lot of gold," etc. Yes, I do, and have declared it for at least 30 years, and have written and published within this time some 10,000 pamphlets, of many tests, and the only reward or satisfaction received for all this labor and expense is that my tests are quoted in every important work on gold mining printed in Europe and America, sometimes giving me credit, and sometimes giving others credit, for my work; and further, from the fact that now my position, through the new process, is going to be fully established by the results obtainable.

As to the cyanide process, those opposed to new things may fight, and wear themselves out on it; the process is going to swim above all denunciations. It has come to stay. Your correspondent also says: "I don't take any stock in assays for gold rock." The assayer, chemist and metallurgist have been berated for many years by the "practical miner," but with this new cyanide process, the chemist and assayer steps to the front as the most important man connected with mining, and men of the class of "practical miner," from now on, will be compelled to take a back seat; and the mill-man who is so "practical" as not to accept assays, of properly sampled lots of ore, as its value, will have to step one side for one who does, and not only this, but one who can work up to them. I will say further, the milling plant that cannot work ores up to a high percentage of the assay value (of ores correctly sampled) had better be remodeled for one that can, for this is what you have all got to come to. The sooner this idea is accepted, by the general gold-mining superintendent, the better off he will be, or his occupation will soon be gone.

It should be accepted by all, that a new condition of things, as respects the working of gold ores, is being rapidly inaugurated, and all this rough way of handling has got to be relegated to the past. One talks of low-grade ores; with such an abominable, slashing, wasteful system as the present one, how can ores be other than low grade? Half the ores milled to-day in California should produce one-quarter more metal at about the same expense, and a good portion of the balance one-half more. I know these ideas do not accord with mill superintendents generally; but let them go into a series of experience, in a good, solid way, to get at the facts of the real value of their bodies of ore, and then see how little they get of it. Then they will wake up to the fact that they had not better be left behind in the march of new discoveries.

As to the new process, no one is running his hand in your pocket, taking your coin, and telling you to charge it to the cyanide process. You need not touch it unless you want to, and certainly should not without a trial. In writing these articles, I don't care a fig whether you like the process or not, or touch it or not. I don't own it. It suits me, and the Calumet Co., and the Shasta Co., both of which are working it on a large scale. From this

every day, practical knowledge, I gather a great deal worth knowing. I am simply, in all this writing about it, doing what a man in one sense is a fool to do—trying to benefit others at his own expense.

What gets me, is that men who are interested in mining, should have a desire to jump every new idea, and will seek to ride down those who desire to advance, simply because they have not the least knowledge of the new process themselves.

About the only sensible feature I see in your correspondent's article is his query as to the Mining Bureau. The Mining Bureau is like too many scientific men. They want to wait until the process gets popular, and everybody is posted; then they will talk wisely. I must here make an exception of Mr. C. H. Aaron, who has had the enterprise to start in for investigating, and wisdom enough to not start off like your correspondent, without knowing what he is talking about.

I doubt if this letter does full justice to your correspondent, but it will give clearer heads something to think of at least; and in the light of the multitude, we will bury men of the class of "practical miner." Yours truly, ALMARIN B. PAUL.

A Brief Reply to "Practical Miner."

SAN FRANCISCO, May 28, 1892.

TO THE EDITOR:—When an old man is also an old fogy it is scarcely worth while to parry his feeble efforts to obstruct the march of improvement which leaves him in the rear. The letter of "A Practical Miner" in the PRESS of May 21st, hardly merits a reply, yet contains a few points which should be noticed.

If Mr. Paul has lost money, which I do not know, in the endeavor to advance the mining interest, he is entitled to credit for his courage, and the fact, for it is a fact, that he has "gone back on his homemade idols" in favor of the new process, only proves his freedom from prejudice and self-conceit.

As to the rates at which ore will be paid for in the custom mill, it is not claimed that all ores can be treated at the low cost of \$1.50 per ton, and I think the company takes considerable risk of getting hold of some lots which may give a good deal of trouble in finding out how to treat them, perhaps some which will not yield to the process. The mill will not be dependent on custom work, and I consider the object of doing such work to be, mainly, that mine owners may test the process on their own ores, and learn either what to do, or, which is equally important, what not to do in regard to putting up works.

The miner who may take ore to the mill will not have to wait longer than the time required to crush, sample, and assay his ore. To deny that gold rock, in which the gold is not very coarse, can be sampled, is to talk in a very old-fashioned way, and the process is not intended to treat coarse gold.

The loss of gold in ordinary milling, is too well established to require discussion as a general proposition, to which there may be individual exceptions.

The proposed test of the new process, that it shall enrich the "honest miner," is not a bad one, but how can the test be applied if the said honest miner is too prejudiced to give the process a trial?

It may be a great consolation to the miner to take his horns and see whether they are saving his gold and sulphurets or not? especially if they are not; but the fact is, the spoon may show that there is a loss, but it cannot show that there is not a loss, because the very gold that the new process will surely save, is precisely that which cannot be found by the spoon.

Again, geologists have often assisted miners in recovering a lost vein, and, if "Practical Miner" had acted on the assurances of a certain great geologist, he might have found gold, and made his fortune in Australia before California was thought of as a gold country.

To conclude; all processes that are now old, were once new, and those which are now new will become old. If this process is, as I believe, of real value, it will outlive both Practical Miner and OBSERVER.

The Old Processes.

LOS ANGELES, CAL., May 25, 1892.

TO THE EDITOR:—I notice in reading your valuable paper a number of articles describing or criticising the various new processes of gold extraction, most notably the MacArthur-Forrest cyanide process. I trust that "Pioneer" and "A Practical Miner" will not take it amiss if I suggest that equally able articles from their pens would prove more instructive to your read-

ers in general if descriptive of the "Old Processes," with which they are doubtless more familiar than with the new.

Men who understand thoroughly even the very simple (?) process of gold amalgamation are very few and far between, and letters from such men giving the details of their own practical experience cannot but be of great interest and benefit. I for one would be glad to add to my scrap-book a collection of practical letters on gold amalgamation.

FRANK A. GARBUTT.

A Verdict for the Side Line.

The celebrated mining case of the Calamity mine against the Illinois Mining Company involved the right of the defendant company to enter upon and extract ore from the ground of the Calamity mine, upon the theory that said company followed a contact vein across the side line between the two claims, the apex of which vein was upon the surface of the Illinois mine.

These mines are situated at Kingston, in Sierra county, and the Illinois Company claiming the possession of such a vein as they had a right to follow upon its dip beneath the surface of the Calamity mine, across the side line, did enter upon and extract a large amount of ore therefrom. The owners of the latter mine brought a suit in ejectment and for damages in the sum of \$60,000.

The case was brought to this county upon a change of venue, says the *Southwest Sentinel* (N. M.), and a trial at a former term of the District Court here, about a year ago, resulted in a hung jury, it being generally understood that the jury stood eleven to one in favor of the Calamity mine in that trial. After one of the most stubbornly contested legal battles ever fought in the courts in this county, occupying ten day's time, the jury reached a verdict for the plaintiff, which carries with it possession of the ore within the side lines of the Calamity mine, debarring the Illinois Company from entering upon the same. Nominal damages in the sum of \$1 were awarded plaintiffs and the costs against the defendant company.

The special findings of the jury in answer to questions of fact propounded by the parties to the suit and submitted to the jury by the judge were:

That there is no vein in the Illinois mine; that there is a contact of lime and shale in the Illinois mine, and that the contact extends through the Calamity, Brush Heap and Andy Johnson mines; that the Brush Heap and Andy Johnson were prior locations to the Illinois; that a lime bed or deposit underlies the shale, and that the ore in the Illinois is found in the lime, and that the footwall has not been ascertained to be well defined.

The defendants asked to have the verdict set aside on the ground that the special findings were inconsistent with the general verdict.

After argument, the court overruled the motion and sustained the verdict of the jury, holding that there was no inconsistency, the special finding regarding the contact in no way conflicting with that of no vein in the Illinois mine.

This was followed by a motion of the defendant company for a "venire de novo" and for a new trial, which, being overruled, notice of an appeal was given.

The attorneys for the plaintiffs were H. B. Ferguson, of Albuquerque, and Fielder Bros. & Heflin, of this city; and Neill B. Field and B. S. Rodey of Albuquerque, and Bell & Wright, of this city, were the defendants' attorneys.

Brilliantly, learning, logic, reasoning and oratory were all displayed by this array of legal talent, and seldom have a Grant county jury been so well entertained and instructed by the legal fraternity as in this case.

Judge McFie's charge was eminently fair and impartial, and will take rank as an able contribution to legal mining literature.

In all the mining camps of this section the irregular deposits and channels of ore in limestone, over which (limestone) there is a shale contact, have not been regarded as veins in the meaning of the law, and in Kingston, Georgetown, Chloride Flat, San Pedro and other places the side lines of claims have been accepted as limiting the extent of the right to extract ore by any claimant. The miners in these camps will be pleased that a Grant county jury has not decided to the contrary.

AS AN evidence of the fact that the present investigations and experiments of electricians are in the right direction, the firefly furnishes direct proof that light may be produced without the accompaniment of heat.

Prizes for Single and Double Handed Drilling.

The National Mining Congress will be held in Helena, July 12, 13 and 14, 1892. Those in charge of the affair at the capital city are working hard to make it a decided success, which it will undoubtedly be. Especially so is this the case in the rock-drilling tournament. Following will be found the rules and regulations, with a list of the principal prizes:

The drill committee of the Montana executive committee National Mining Congress, respectfully announces a three days' tournament of rock-drilling contests during the second session of the National Mining Congress in Helena, Montana, July 12, 13 and 14 next, and offer the following prizes in connection therewith:

FOR DOUBLE-HANDED DRILLING.

First Prize	\$700
Second "	400
Third "	300
Fourth "	250

FOR SINGLE-HANDED DRILLING.

First Prize	\$350
Second "	200
Third "	150
Fourth "	100

The entrance fee for double-handed contest will be \$25 each team, and \$12.50 for each individual entering the single-handed contest.

This committee will appoint three judges, whose duty shall be to take entire charge of the drilling exercises, looking to the selection and placing of granite of uniform character, marking thereon the places where each team or man shall drill; to start and stop the men; measure the depth of the drill holes, and at the close of the tournament to award the prizes, giving to the team and man drilling the deepest and best hole, in their respective contests, the first prizes; to the team and man drilling the next deepest and best hole, in their respective contests, the second prizes, and so on, giving certificates upon which to draw the amounts won. The decision of these judges shall be final.

Each county in any mining State of the United States shall be entitled to send three teams to the contest, also three single-handed men. In the event more than that number for one county desire to compete, it shall be determined by mutual agreement or home contests, which shall be admitted.

All entries must be made at least five days prior to the first day of the tournament. In case of inability of any of the contestants to be present during the tournament, others from the same county may be substituted, at the discretion of this committee.

All drills used by the double-handed teams shall be of seven-eighths steel, and the hammer shall not exceed eight pounds in weight.

All drills used by the single-handed men shall be five-eighths steel, and the hammer shall not exceed four pounds in weight.

Each team or man must furnish their own drills and hammers.

All holes shall be down holes, and in granite blocks, uniform in character, to be provided by this committee.

The time of drilling shall be limited to 15 minutes, and two teams and two single men shall work at a time.

In case of tie, the winner shall be decided by again drilling, as may be decided by the judges.

Any contestant who shall violate any of the rules, or refuse to obey any instructions of judges, shall forfeit all right to contest or to receive any prize.

These rules are subject to change by the drilling committee.

The tournament will embrace contests of three (or more, if necessary,) successive nights, commencing July 12, 1892, at 8 o'clock each night, and will be held in the new Helena Auditorium, which has a seating capacity of over 2000.

Parties desirous of offering special prizes are requested to notify this committee through B. Brown, the secretary, Helena, Montana.

REFRIGERATING MACHINES.—Prof. J. E. Denton and D. S. Jacobus of Hoboken, N. J., at the meeting of the American Society of Mechanical Engineers in this city, presented a summary of results of principal experimental measurements of performance of refrigerating machines. The paper deals with tests of air machines, ammonia machines of both the absorption and compression type, sulphur-dioxide or Pictet machines and carbonic acid machines. The refrigerating effect of the first is equivalent to 3.4 pounds of "ice-melting effect" per pound of coal required to drive the steam engine, or 43.1 per cent of the theoretical result. In the second, the "ice-melting effect" per pound of coal is 20.1 pounds, which is 52.2 per cent of the theoretical effect. In the third, or compression type of ammonia ma-

chine, the "ice-melting effect" varies from 46.29 to 16.14, according as the suction pressure varies from 45 to 8 pounds above the atmosphere, this pressure being the condition which mainly controls the economy of compression machines. These results are equivalent to realizing from 72 to 50 per cent of the theoretically perfect performance. The Pictet machines are practically as economical as the ammonia. The carbonic acid machines have an efficiency considerably less than the ammonia, and as they require pressure reaching 800 pounds per square inch, there seems to be no reasonable ground for their use.

Hard Work for Nuggets.

The Nevada *Transcript* published an item about M. F. Skeahan bringing to town about \$200 worth of gold nuggets, varying in size from \$25 to five cents. From Mr. Skeahan the *Transcript* obtains the following particulars of where and how he obtained the nuggets, and other interesting notes about his mine. The mine from which the nuggets came is situated on Democrat Hill, near Lowell Hill, Little York township, and is known as the Democrat gravel mine. The property embraces 160 acres of patented ground, and is owned by Mr. Skeahan and Richard Neville of French Corral. The channel is known as the old Remington Hill channel, and passes through the whole ground owned by the above named gentlemen. A tunnel has been run in the mine a distance of over seven hundred feet. At the end of this tunnel an incline shaft has been sunk a little over two hundred feet, and at the bottom of this shaft is where the gold nuggets were taken out. In order to get the nuggets and coarse gold, Mr. Skeahan, who is working alone in the mine, is compelled to handle the gravel six different times before he gets any gold from it. He has a hard as well as well as a very novel way of getting the gravel to the washing dump. First—He shovels the gravel out of the channel and throws it up on a platform four feet high. When he has a car-load or more on the platform he goes up to platform No. 1. Second—He then throws the gravel from there up on platform No. 2. Third—From this to platform No. 3. Fourth—He then takes the gravel up again and dumps it into a wheelbarrow, and fifthly, wheels it up the incline shaft about one-hundred and eighty-five feet to the tunnel. Sixth—He then shovels the gravel into a car, and runs it seven hundred feet to the sluice where it is washed. He has been making two and three trips of this kind a day, off and on, for the past six or seven weeks, and by so doing, he says, "I have made first-class wages, even if I did work at considerable disadvantage." The Remington Hill channel is known to be five thousand feet long and twelve hundred feet wide, and is unquestionably one of the richest channels in the State.

Mr. Skeahan says the ground prospects from three or four colors to the pan up to fifteen or sixteen—from the grass roots down to the bottom of his incline shaft. He says that if he was permitted to hydraulic for a few months he could take out more money than he would know what to do with.

Disposing of the Sewage.

The Polyclinic lecture on the Sewage and Sewerage system of San Francisco, delivered by Dr. I. H. Stallard, has been printed in pamphlet form. No more vital question than this could occupy the attention of the medical faculty nor yet of the general public, which latter should feel under deep obligation when one so competent devotes his time to the investigation of a matter of such moment to every resident of the city. Dr. Stallard, who is not only a statistician, but an original investigator, has shown great industry and intelligence in his treatment of this subject, wherefore his recommendations and opinions are entitled to be carefully considered by our municipal authorities when legislating on these sanitary questions, and that, notwithstanding these opinions may, on some points, conflict with those heretofore entertained by our city engineers and our city fathers. It has generally been supposed that a few large sewers would answer a better purpose than a larger number of small ones—an idea that Dr. Stallard proves to be erroneous—this very high authority exploding also divers other popular errors.

The substance of this pamphlet ought to have wide circulation—a mission which the daily press ought to feel itself appointed to perform. Copies could, we presume, be obtained from Dr. Stallard, Sutter street, also from the Board of Health.

Varieties of Silver Ore.

"How many different kinds of silver ore are there?" said the Tenderfoot to the Old Timer as they stood in front of a Main street saloon, looking at some black sulphurets a prospector had just brought in from some other man's dump and was trying to claim it for the product of ore of his own wild cats.

"Well, to tell you the truth, I don't know. Suppose we go and look them up from Webster. Although he does not give them all, we will see how many we can find, and guess at the rest." So they meandered off down to the printing office and got Webster's Unabridged, and this is what they find:

"Silver, a soft, white, metallic element, very malleable and ductile, and capable of a high polish. It occurs pure in nature, and also in combination with sulphur, arsenic, etc., and with ores of lead, copper and gold. "Black silver, a massive, compact, sectile mineral of an iron black color, consisting of silver, antimony and sulphur, and valuable as an ore; also called brittle silver ore or brittle silver glance.

"Gray silver, an ore of a light steel gray, silver white, also blackish lead gray color, consisting of silver, lead, antimony and sulphur; antimonial sulphurets of silver.

"Native silver, a mineral of a silver white color and metallic luster, occurring usually in filiform, reticulated, arborescent forms, and consisting of silver, with some copper, gold, platinum, antimony and other metals. It is sometimes found in large masses.

"Ruby, or red silver, an ore of silver of a ruby-red or reddish-black color. There are two species: The dark red contains 59 per cent of silver united to sulphur and antimony, and the light red contains 65 per cent combined with sulphur and arsenic.

"Silver glance, a mineral of a blackish lead gray color and metallic luster, consisting of sulphurets of silver; also called vitreous silver.

"Aerosite, a dark red silver ore, argentiferous mercury, the native amalgam of silver.

"Argentiferous, containing or affording silver; specifically containing silver as an incidental ingredient."

These are some of the ores of silver. The names of several other kinds of silver ores are merely combinations of name. For instance, carbonate of silver is a combination of silver and carbonic acid. Bromide of silver is a combination of bromic acid and silver. Chloride of silver is a combination of chlorine and silver. Sulphurets of silver is a combination of sulphur and silver, and these combinations differ in color. Bromide of silver is a dark velvety green, a glossy indigo. Chloride of silver is a yellowish waxy color, like a clear horn, and is usually called horn silver. Horn silver is the native chloride of silver. Sulphurets of silver is black and glossy, looks like coal soot, and all of them will receive a high polish.—Old Timer in Belt Mountain Mine.

THE growth of the ocean steam marine causes a scarcity of naval engineers. Chief Engineer Melville argues that the modern naval engine is a wonderfully complex apparatus, every part of which must be constantly watched, and that, where engineer officers do not have enough assistance, they are under a constant nervous strain for fear of accidents. Secretary Tracy also says that it is "false economy to put in our new vessels all that is most advanced in high-pressure machinery and then to provide an insufficient number of officers."

MAHOGANY varies in price according to a great variety of things. Some fetches as little as ten cents per square foot, while some is as high as 50 cents per square foot. Little of the wood brings more than this, though now and then unusually fine mahogany sells at 70 cents per square foot. A cargo of 300,000 square feet in squared logs may be worth \$50,000. The best walnut, now unpopular, fetches more than any but the finest mahogany.

AUSTIN MINES.—The *Central Nevadan* says the Yankee Blade mines near Austin are producing some fine silver ore, specimens of which run as high as \$10,000 per ton. There are strong probabilities of the Austin Mining Co. commencing vigorous work on the big tunnel at Clifton, which is to be three-quarters of a mile long, operated by hurelgh drills, lit by electric lights, and which will crosscut the numerous ledges of Lander Hill.

AN English firm has invented an ingenious device for turning on the currents for electric lamps at a certain hour. An ordinary clock is so adjusted that at the desired moment a spring is released, permitting a pair of pivoted contacts to fall into mercury cups, thus completing the circuit.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger: The water is being slowly lowered in the Hector mine. They are nearing the 300-foot level, and the condition of the shaft so far is found to be good. The only trouble encountered yet is with the track, which needs the closest attention. Owing to the lapse of so many years, the iron on the track has almost completely rusted out, causing a good deal of inconvenience and trouble. False tracks are used, and the water level is steadily descending. A valuable improvement is being made at the Wildman mine, in the shape of a track from the mouth of the shaft to the blacksmith shop, a distance of 60 feet. The track will be provided with a small car, the object being to facilitate the taking of tools to and from the blacksmith shop. Some of the tools, especially the Burleigh drills, are weighty and involve much hard work in packing to the shop for sharpening. The improvement involves little expense, but is quite important as a labor-saving device.

GOLD MOUNTAIN.—Amador Ledger, May 28: Last Wednesday we visited the important mining enterprise now being prosecuted by the Gold Mountain Company at Quartz Mountain, and which, under the able management of W. B. Farwell, the superintendent, is proving a financial success, and that, too, in face of several failures to work the mine profitably. The prevailing impression is that Quartz Mountain, as its name implies, is simply a mountain of quartz without any defined walls or other characteristics of a regular ledge formation; that the existence of this gold-bearing deposit was a freak of nature, unexplainable upon any scientific theory; that the quartz existed merely as a crust, covering a considerable portion of the crest and sides of the mountain. A visit to the scene has effectually dispelled this notion. The vein here differs little from other quartz ledges in the county—that is, as far as any peculiarities in its formation are concerned. The quartz deposit was evidently formed before the mountain, and in the convulsion which created the mountain the quartz was partly thrown from its native position and laid upon the surface, forming a cap on the crest and side of the hill, so that while considerable of the surface croppings consist of a layer of quartz of varying thickness, below this a well defined ledge is encountered, with foot and hanging walls distinctly marked. The top rock, owing to this displacement, lies almost horizontally, and as far as the ore body has been explored, it has less pitch than quartz veins in this county usually have; also, the course of the vein, instead of being almost due north and south, is northeasterly. It is probable, however, that these departures from the general rule are due to the superficial displacement, and that as depth is reached the vein will take its true course and regular dip. Three tunnels have been run into ore, the lowest tapping the ledge 150 feet from the surface. Here the vein is from 10 to 12 feet wide, and richer than above. Nearly all the rock carries gold in paying quantities. Very little is thrown away as waste, which is remarkable considering the vast quantity forming the cap. Some of the ore yields as high as \$10 to \$15 per ton; the average is between \$4 and \$5, which yields a handsome profit on account of being so situated for economical working. The 20-stamp mill is about half a mile from the mine, and two teams are now employed in hauling ore. This method of supplying the mill will soon be dispensed with. A car track is being laid connecting the two, and this will be completed and in running order inside of a week. A large ore bin has been built at the end of this track, and this will be connected with all the drifts supplying ore for the mill.

MISCELLANEOUS.—At the South Eureka, prospect drifts have been started east and west. John Bowden is in charge of the Amador Queen mill. We are informed that the last cleanup, from a run of two weeks, yielded at the rate of \$15 per ton. A gentleman from San Francisco was here last week looking at the Bright mine, near Jackson. He was much pleased with the property, and will endeavor to get capitalists to take hold of it. This is one of the best prospects to be found on the mother lode.

Kern.

A NEW MINING ENTERPRISE.—Bakersfield Californian, May 28: Jos. Weringer, L. Gubm and J. H. Mayfield have commenced to open the Jackson mine, on White river. The mine is in slate and carries an 18-inch vein of quartz, which yields from \$12 to \$22 per ton in gold. It is easily worked, being mostly picking ground. Thirty feet from the surface a level is being run into the hill, thus gaining depth with its progress. The Woody mine, opposite the Jackson, in the same formation and of like characteristics and quality, is also being worked by the same parties. For milling the quartz, a water power arrastre is used, being so located that 200 inches of water, with 20 feet fall, supplies the motive force.

Modoc.

THE LATE MINING DISCOVERIES.—Alturas Herald, May 28: The mining excitement at Willow Ranch still continues, and well it might, for, after a personal investigation, we satisfied ourselves that the discoverers of the claims have a good thing. Last Friday we left Alturas and drove direct to Willow Ranch. The first location we came to was that of J. A. Barnes and James Burns, and is situated about a mile and a half north from Willow

Ranch. This was the first claim discovered, and Mr. Burns has the credit of being the discoverer. They prospected the ledge in various places on the side of the mountain, and found that the ore was free-milling and carried gold, and this spring commenced driving a tunnel in from the base of the mountain, and expect to tap the ledge at a distance of a hundred feet. These gentlemen are working their claim in systematic style, and when they come to the ledge and find that the ore prospects as good as it does on the surface, they will own a piece of property that will be worth money. The Robinson & Cowan claim is situated about a hundred yards north of Burns' mine, and there is a vein of ore in sight 24 feet wide. The foot-wall is granite and the hanging wall is porphyry. The indications are that the ledge will become wider and the ore richer as depth is attained. These parties have opened the ledge on the side of the mountain, for a distance of 30 feet; at a depth of from one to ten feet. We extracted some of the ore, and, after crushing it in a mortar, panned it down, and there was gold and plenty of it. Even the dirt taken out of the vein carries gold. An arrastre is being put up by Mr. J. A. Barnes, and other parties owning claims in that vicinity will follow suit. This body of ore crops out in various places from Davis Creek to Lakeview, Or. The parties who have located claims beyond Robinson's mine are A. B. Layson, W. M. Mills, L. B. Moss, Morris Dick, L. Selts and other. Dave Jones, of Lakeview, is interested in the Mills' claim, and will put a force of men to work this week. The hills are lined with men prospecting, and it would not surprise us if new and richer finds are found in that neighborhood in the near future. Deep snow on the ranges back of where the ledges were discovered have hindered the ranchers from prospecting them, but just as soon as they become bare, hundreds of men will be searching that portion of the district for the precious metal. There is an abundance of wood and several large streams of water in close proximity of the mines which could be used to run the mills. Taking everything into consideration, we believe that Modoc county will soon produce a vast amount of bullion.

Mono.

THE MONO.—Bodie Miner, May 28: During the past week, north drift No. 2, 600 foot level, was extended 22 feet. Upraise No. 1, north drift, same level, was extended 13 feet. There are about five inches of quartz in fact that give fair assays. West crosscut, same level, was extended 14 feet. We stopped crushing ore on the 20th inst. We will put in new pans and settlers before starting the mill again. Average battery samples, \$40.93; average tailings samples, \$6.45. There were employed five miners, one carman, and, jointly with Bodie, one engineer, one blacksmith, one carpenter, one fireman, one watchman, one laborer and one foreman. Employed at the mill, two engineers, two battery men, two panmen, two tankmen, one laborer, one foreman.

THE BODIE CON.—During the past week, east crosscut No. 1, 700-foot level, was extended eight feet. East crosscut No. 1, 550-foot level, was extended seven feet. North drift from above crosscut was extended 11 feet. In the face there are about four inches of quartz that prospects well. South drift from above crosscut was extended ten feet. Upraise, 400-foot level, was extended four feet.

Nevada.

RIVER MINING.—Grass Valley Union, May 26: Several of the companies that worked in the bed of the South Yuba river last season will resume operations this season, feeling confident that the work done there has shown just where pay dirt will be found. One of these companies will be composed principally of residents of Grass Valley. One of the Chinese companies that worked on the river last year, and went to considerable expense, took out enough gold to pay all expenses and divide \$200 each to the 13 members constituting the company, and yet they were unable to get down to bedrock. It is known that there are places in the river that were never worked in the early days, and confidence is felt that there is much good ground yet left that will pay well for being worked.

GOOD LEOGE STRUCK.—Grass Valley Telegraph, May 26: A few days since we made mention that the Oak Tree had started its machinery to work and that they had started their miners on the course to delvay down in the bowels of the earth. The miners commenced the labors of fixing up the old shaft and last night they found a shaft about six inches in width, and ore from it shows free gold in a most encouraging quantity. The ledge was hardly expected to be encountered at the present depth, and is thereby a gratification to the owners. The rock can be seen at Granger & Watt's store.

OMAHA DIVIDEND.—The Omaha mining company of this place declared dividend No. 7, and it was payable on the 24th (yesterday). The dividend was of the amount of 15 cents per share. There is no material change in the mine as far as quality of ore is concerned. The mine is looking well in whatever level Mr. Mainhart is causing it to be worked and the regular dividend is an assured thing for many years yet.

CHAMPION IMPROVEMENTS.—Nevada City Herald, May 28: Things have a busy, bustling look down at the Champion. The new mortars are in, the mill is pounding away once more, and the 60 men employed there are again on shift. Grading is going on for the ten new stamps, which are to be added to the 15 now in use. The addition will be put on the west side of the present battery. Two tracks have been laid, and a line of ore cars is used in the grading. A new concentrator is being put in—a six-foot Frue vanner, the largest in the county. Lawns do not seem to worry the Champion Company. They go right on with their improve-

ments, spend thousands of dollars and employ more men than any mine in this district.

A MINE SOLD.—Stewart & Donohue have sold the Maryland ledge to J. L. Postelwal and Joseph Floyd, of this city. The Maryland is located on the South Yuba river, about three miles above Washington. It is a good mine, and is pretty well developed now. The ledge is four feet thick where it is now exposed, and there are 1500 feet of backs. The rock shows well in free gold, and averages \$50 per ton. We were shown some this morning which will run much higher than that. The mine is worked by a tunnel, two shifts being now at work. Three shifts will be put on next week. The gold from this ledge is worth \$18 per ounce.

San Bernardino.

THE MACEDONIA.—Redlands Graph, May 22: Mr. Farnsworth of Victor, Dr. Pritchard and Mr. House of Los Angeles and Mr. Nowlin of Riverside have bonded the mine known years ago as the Macedonia. It is situated in what was once known as the New York mining district, but which is now a part of the Palm mining district. It is about 40 miles west of the Colorado river and 26 miles north of the Santa Fe railroad. The property is also within 20 miles of Green Campbell's mines, which are said to be producing steadily. The above-named gentlemen are very hopeful of good results, as the last ore taken out ran \$900 to the ton. The property was worked 20 years ago by the well-known 'Lige Moulton and partners. At that time the Indians were much more numerous and troublesome, and some of the men interested in the mine were killed and the others were driven away. In this way it became lost and remained unworked until a comparatively recent date. There is also said to be paying gold ore in that region, and that a lot of it, after a long haul on wagons across the desert, was sent to San Francisco, and paid \$300 per ton above all expenses. The old New York district was rich in low-grade ores, and a railroad through that section would set thousands of men at work. Should the railroad from Utah come down the proposed route, we predict the starting up of a dozen prosperous mining camps along its line from Utah to a connection with the crossing of the Atlantic & Pacific railroad. That country is a treasure house of the useful and precious metals.

Shasta.

A BIG MINING SALE.—Democrat, May 26: For some months past, quiet negotiations have been going on for the sale and purchase of the Morton and Bliss mining property on Squaw creek. This group of mines is a portion of the locations originally made by Jack Conant and subsequently sold to Riley, Bliss and Morton. Conant, it will be remembered, was the discoverer of the mines in this camp and located 12 or 14 claims, about half of which he sold to Riley shortly after he located them, and with the money derived from this sale developed the Uncle Sam mine, the principal claim in the group he reserved. Later on he sold the Uncle Sam group to the Sierra Butte Mining Co. for \$150,000. Mr. James, the superintendent, negotiating the purchase. The mines sold to Riley, Bliss and Morton are known as the Riley group. Mr. Riley subsequently disposed of his interest to Morton and Bliss of New York, and now Sig. Weil and Barney Conroy of this city have purchased the property from Morton and Bliss. The purchase price is \$150,000, payments to be made in convenient installments. The new proprietors will take possession of the property to-day, and will immediately start up the ten-stamp and two Huntington mills, and put a large force of men in the mine. The purchase includes some other mining property in other mining districts, and all the improvements, mills, tools and other personal property attached to the mines. Ed Hume, who has been foreman for the Hart mine in Old Diggins district, will take charge as superintendent for Weil and Conroy. We are pleased to know that this big mining property has passed into the hands of Shasta county men and residents of Redding. Mr. Morton, one of the former owners, is Vice-President of the United States, and Mr. Bliss' name is familiar in every mining camp throughout the United States and Mexico.

MINING ITEMS.—M. D. Butler and son Frank, of the Altoona quicksilver mines, recently purchased the old Delta mine on Dog creek, about six miles west of Delta. Last week they went to work to prospect the mine by starting a new drift westward from the lower tunnel. The first shot put in exposed a rich body of free gold ore, considerable of which is specimen rock. How extensive this body of ore is, remains to be seen. The tunnel was driven past this rich vein several years ago by S. M. Whitlow and Ed Sanders, the former owners of the mine, but it was not their luck to discover it. Gerald O'Shea of Trinity Center reports to us that some very rich placer diggings were discovered early this spring on Swift creek, near Trinity Center. The discoverers of the ground have already taken out considerable dust. Considerable of it is heavy and coarse. A chunk worth \$150 was picked up in one of the claims. We hear that the Walker Bros. are putting up a 20-ton plant of the MacArthur-Forrest cyanide process on their mine on Star gulch, Old Diggins district. Shasta county miners are beginning to believe that this new process is specially adapted for working the refractory gold ores in this county. This will make the second plant of that kind in the county—both in Old Diggins district. Oliver Sunderhaus, of the Young America Mining Co., who mined on Squaw creek three years ago, was a visitor in town yesterday. He has been up in the Klamath river country and Southern Oregon looking after mining property, and expects to do some prospecting on the Klamath river this summer. The South Fork Milling Co.'s plant is nearly completed. The roller

crusher shipped from Denver some time ago is yet on the road, but is expected to arrive at Anderson any day. When that is put in place, the plant will start up. The new owners of the Hidden Treasure mine are preparing to put up a stamp mill on the mine, and will have it in operation as soon as possible.

Siskiyou.

GRAVEL.—Yreka Journal, May 25: We learn that Senator R. H. Campbell has made another rich strike in his hydraulic mine at Quartz Valley, the bedrock being covered with a great abundance of coarse gold at last point where his hydraulic elevator reached it. He has been making tests all over the claim under instructions from the English company to whom the ground is bonded, and every test proves the entire extent to be rich at and near the bedrock. Mr. Campbell will start halow again in a few days to confer with the agents of the English company, now ready to proceed in working the claim on an extensive scale. The delay of the company in taking charge as soon as expected has been caused by the death of a prominent member of the company, whose place has been filled by other parties filling his place in providing the means necessary to complete the syndicate capital. The Phil Mott claim at Klamath river has been paying exceedingly rich this spring, the cleanpp from the last cut yielding over \$2000. The derrick has just been moved for the purpose of sinking down a new cut. The China claim, near the Mott claim, is also paying handsomely, and the owners want to put on night shifts, but have been unable to secure hands. They sent agents to Ashland, Jacksonville, Sisson and other places for Chinamen without being succesful, hence will not be able to work the mine to as good advantage as they would like. The Centennial claim, just below Honolulu, on the Klamath, is now being opened by 27 young Oregonians, it being impossible to secure hands in this county, and the superintendent, W. N. Gott, expects to take out considerable gold dust during the river mining season. He has been delayed somewhat in starting operations, owing to the difficulty in securing hands. All the other river claims are being fixed up for successful work, and the owners are also troubled considerably in the matter of securing sufficient help. Down at Oak Bar, on the Klamath, the river miners are busily engaged in constructing wingdams for the purpose of getting down to the bottom of the channel, where gold dust is plentiful in the crevices of the bedrock, and in the gravel for several feet above. At Buckeye Bar, in the same vicinity, the work of dam-building is progressing steadily, although hands are scarce and hard to get, owing to so many Chinamen leaving to make room for industrious white labor. James Ironsides, who has some rich quartz mining property on Cherry creek, about nine miles south of Yreka, says the prospects in his Cherry Creek mine look fine, and that as soon as he completes an amount of dead work necessary to open the ledge in good shape, will take out rich ore in great abundance. His ledge extends through the mountain at the Deadwood divide between Cherry creek and Greenhorn, and is of good average size and richness to pay handsomely. He has other rich ledges in the same vicinity, which he intends to develop later, when his Cherry Creek mine is opened for successful working. Gena Dowling has been finding some fine prospects in his quartz ledge at Cherry creek, lately, and secured \$71 in almost solid specimens last week. The ledge contains many rich spots, where the gold is very thick, and almost free from any other substance.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Chronicle, May 28: 1100 level.—From the end of the drift running south from the top of the upraise 73 feet above the sill floor, which was carried up from the mouth of the west crosscut No. 3 from the main south drift 310 feet south from the shaft station, the west crosscut has been extended 28 feet; total length, 154 feet; continuing in vein porphyry, with fine lines of quartz of low assay value. 1500 level.—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. From the upraise which was carried up from the end of the crosscut run west 36 feet in from the main south drift, 155 feet south from the shaft station, we have continued to work upward and to extract ore of fair quality. 1600 level.—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted. The ore streak on the east side of the old stope timbers has become narrower and of purer quality. 1650 level.—Have continued prospecting west from the upraise, 35 feet above the sill floor, which was carried up 59 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. From the north end of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality. From the bottom of the winza sunk 28 feet in this locality through the old timbers, on the east side of the northwest drift, a south drift has been advanced in a porphyry and quartz formation of low assay value. 1750 level.—In east crosscuts No. 1 and No. 3 from the main south drift, in working upward from the sill floor, have continued to extract some milling ore. 1800 level.—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. The winze No. 2, started in the drift run north from this same east crosscut, has been sunk 15 feet; total depth, 30 feet; continuing in a quartz

formation carrying low assay value. There have been extracted from all parts of the mine during the week 1078 780-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was \$29.07 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was \$22.96 per ton, per battery samples. Bullion shipped to the Carson Mint, assay value, \$31.101.04.

OPHIA.—1465 level.—The largest portion of the week having been spent in laying air pipe for the purpose of ventilating and drilling, work was then resumed in the drift running south 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, and ten tons of ore were extracted therefrom and raised to the surface, the average assay value of which was \$19.95 per ton. The face of the drift is in porphyry and quartz, carrying an assay value of \$19.50 per ton.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 19 feet; total length, 30 feet; continuing in a porphyry formation, showing fine lines of quartz.

UTAH.—340 level.—From the west crosscut, 340 level, at a point 595 feet from the shaft, the north drift has been extended 56 feet; total length, 226 feet. This drift is showing more quartz of low assay value, mixed through the porphyry formation.

SIERRA NEVADA.—West crosscut No. 1 from the north drift of the Kenosha tunnel, 1000 feet in, has been advanced 40 feet; total distance, 95 feet; face in porphyry. The joint Sierra Nevada and Union west drift, 900 level, was extended during the week 30 feet, making its total distance west of shaft 2024 feet; face in porphyry and streaks of quartz.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, has been advanced during the week 30 feet; total distance west of shaft, 2024 feet; face in porphyry and streaks of quartz.

ANDES.—On 420 level north drift from west crosscut No. 2 extended during the week 26 feet, continuing in quartz.

BEST & BELCHER.—900 level.—East crosscut No. 1 has been advanced 17 feet; total, 176 feet; face in hard porphyry and seams of clay. West crosscut No. 1 has been extended 20 feet; face in hard porphyry and quartz.

GOULD & CURRY.—200 level.—Northwest drift, 435 feet west of shaft, has been extended 21 feet through porphyry and bunches of quartz; total length, 312 feet. 400 level.—East crosscut No. 1, from northwest drift, has been extended 20 feet through soft porphyry and quartz; total length, 62 feet.

HALE & NORCROSS.—On the 800 level are making some necessary repairs to the west drift, 900 level.—We are extracting ore from above this level and repairing main drift. Hoisted from this level during the week 233 cars of ore. 1000 level.—South drift from bottom of 900 north winze, started last week, has been advanced 15 feet. Face shows some fair grade ore. We have laid a track and timbered this drift as same advanced. This level furnished 15 cars of ore during the week. 1100 level.—From our north and south stopes above this level we are stopping out ore. There is no change of importance in these stopes since last report. Are doing considerable repairing on this level and hoisted from same during week 140 cars of ore. 1300 level.—Are stopping out ore below this level north and south from the winze. Are also working at the new station and chuta at the head of main incline, and re-timbering north drift from the station. Extracted from this level 38 cars of ore during the week. 1640 level.—Have cleaned out and re-timbered incline a distance of 15 feet the past week. Hoisted during the week 426 cars of ore. Shipped to Brunswick mill 427 1900-2000 tons. Average assay of railroad car samples of ore shipped to Brunswick mill for the week \$22.37. Average battery assay for the week \$15.89.

OCCIDENTAL.—Have stopped work in west crosscut from the south drift, 400 level. North and south drifts on this level are in 39 and 49 feet; both show some pay ore. North drift, 450 level, is in 51 feet and continues in fair-grade ore. West crosscut No. 2, 750 level, is in 50 feet and continues in low-grade ore. The main north drift is in 443 feet from winze station. The Sutor tunnel drift is in a total distance of 576 feet.

Tuscarora District.

NAVAJO.—*Times-Review*, May 27: Stopes above the 350-foot level are looking same as at last report.

UNION MILL.—Mill running, crushing 1644 tons Nevada Queen ore for the week.

BELLE ISLE.—West crosscut, 250-foot level, extended seven feet. North drift, same level, extended seven feet. North drift, 350-foot level, extended four feet.

GRAND PRIZE.—Concentrator running on Nevada Queen ore; crushed 473 tons and 100 tons combination during the week; now running all Nevada Queen.

NORTH BELLE ISLE.—No. 1 north drift, 400-foot level, extended 19 feet. No. 1 upraise from this drift extended 19 feet. South intermediate drift above the north 500 extended six feet, showing good ore in fair quantity. The various stopes are looking better than at last report.

NEVADA QUEEN.—Second level.—East intermediate from No. 1 chute, stopes have been started. West intermediate drift has been run 12 feet, in ore. South side of drift is all first class, will average about \$200 per ton; on north side, 1½ feet of first class, balance second class; Stopes started 15 feet from the chute (No. 1) have broken into the ore, from the footwall up

—14 feet—no hanging wall as yet. The ore extracted is one-fourth first class, average assay \$190 per ton, the balance second class, average assay from battery 29.72 per ton. East intermediate stopes from No. 2 chute have two feet \$185 per ton; west stopes from same chute, the ore is never four feet, average 220 per ton. East intermediate from No. 3 chute advanced 16 feet; south from same 15 feet and west five feet, connecting with No. 5 chute. From No. 5, have run 12 feet toward No. 6, and east from No. 6 five feet, one foot of first-class ore in both drifts. No. 7 and No. 6 chutes have been connected, exposing ore all through. South drift on west vein has been run 15 feet exposing one foot of ore, assaying \$250 per ton. North drift extended nine feet, one foot of fair grade ore. Stopes between the south and north drifts are looking well. No. 1 winze from south drift is down 20 feet, exposed 1½ feet of first-class ore, but not looking so well in the bottom. The above openings have produced for the week 117 cars of ore, average battery assay \$269.80, and 610 cars second class, average assay from concentrator \$29.72 per ton. Third level.—South intermediate drift from chute No. 3 has been run 16 feet, following ore two feet wide; produced four cars ore average assay \$375 per ton, eight cars second class, assay value \$45 per ton. Have received from Union Mill Company on account of ore, \$30,000.

Ferguson District.

PROGRESS OF THE CAMP.—*Pioche Record*, May 28: As depth is attained on the April Fool mine, the showing of an immense body of ore becomes greater. The owners are preparing to make a shipment to Salt Lake. Parties are driving an artesian well on the edge of Dry Lake, near here. While out in the hills the other day, J. A. Denton found an old prospecting outfit, which was evidently used 20 or 30 years ago. The find included several picks, a gold-pan and several other articles used in prospecting, and was no doubt used by some early '49er. From a sample of ore taken from the prospect owned by S. R. McLaughlin, James Pierson and W. C. Glissan, an assay made in Pioche went \$13 860 in gold to the ton. The ledge crops out of the ground for several hundred feet, and would indicate the presence of a large body of ore.

ARIZONA.

COPPER BULLION.—*Prescott Courier*, May 28: A carload of copper bullion from Copper Basin is piled upon the platform of the P. & A. C. depot for shipment. Teams are now steadily employed hauling coke to the smelters and bringing back bullion on the return trip. Peery & Kerr, two old-timers of Stanton who have several very good mines, have settled their differences and started to open up their properties, and, with a good stamp-mill at Stanton owned by Mr. Kerr, will very soon be in the bullion market, as their properties now have stored on dumps much richer ore that will be milled very soon. The placer ground near Stanton, of which Mr. Fuller is superintendent, is a very valuable property. Excavations have been made for his extensive plant; the four miles of pipe is laid and water is running to the sight that will be the first point of opening. Tests show an average of \$1.30 per cubic yard. The machinery is expected to reach the ground by June 10th.

GOLD ORE.—*Prescott Courier*, May 28: Dr. Lewis has just returned from a trip to the Yarnell mine, Stanton and the Weaver district. The Yarnell is dropping 20 stamps as regular as clockwork, on good grade gold ore. The water supply is limited at present, but he affirms that, with a pipe line from the Genung spring and a tram from the mine, a constant output of at least \$500 per day would be yielded. The gold is as pure as is ever found in ore. The ore bodies on the surface show several hundred thousand tons of ore of remarkably uniform richness, and under the excellent management of Mr. Palmer the Yarnell will be, in the near future, one of the heaviest ore producers of Arizona. The mill cannot be surpassed for neatness and working capacity for 20 stamps in any country. The daily output now, with all disadvantages, will not vary far from \$400. Much credit is due to Mr. Palmer for his nerve and judgment in struggling against such adverse circumstances as he has, and if our merchants and men at home will only realize that this country is their country, and look to the real worth of their mining interests and foster them a little closer, they will realize that they have many more mines within their easy reach, and instead of groaning and lamenting the dull mining outlook they will realize profit in the immediate future. What they want is not to try to drag in Eastern capital and reap a harvest from them, but foster, encourage and give substantial aid to those at home trying to develop their mining claims, and a mineral world will open up that will be sought by outside investors with capital.

RICHER THAN EVER.—*Phoenix Gazette*, May 22: Tom Greenhaw made some valuable locations in the Harqua country during his trip out there, and says he expects to clear a cold \$50,000 within a year. Everybody is in good spirits in that district, and have great faith in the future of the camp. Another big cleanup was made in the Bonanza last Sunday. The ingot of gold secured this time is ten pounds heavier than the \$81,000 one brought in a short time ago. The nugget weighs 350 pounds. The San Francisco parties who are trying to buy the mine have not closed the trade yet, and Mr. Hubbard says he would rather they would not, though he will come up to his part of the trade if they want to close the deal. They have had a thorough survey made of the mine, and have had the lead tested from top to bottom in every opening, and the experts have gone to Frisco to report. They ex-

pressed themselves as being very highly pleased with their examinations, and there is not much doubt but that the mine will be sold.

ENCOURAGEMENT.—*Enterprise*, May 28: The mining industry of Southern Arizona has received considerable encouragement of late, by the advent of men believed to be good, practical mining men, and the experiments now being made in Washington Camp have awakened new life in the many who for years have bed unquestioned faith in that camp's future. Chloriding is carried on with fair success, and the ore shipments from Crittenden testify to the merits of that section. The Holland mine, until recently so industriously worked by York, Fitzsimmons and others, is now turning out a handsome product of about 60-oz. concentrates. Mr. R. R. Hedley, the head of the company now operating the mine, has the reputation of being a thorough smelting man, and at present is in New York, presumably for the purpose of new machinery, while his partner, Chas. Taylor, remains at the mine, superintending the management there. The Belmont mine, owned by Bacon, of San Francisco, and Tom Yarkes, formerly of this place, is said to be hoisted to Denver parties for \$200,000, and if the sale is consummated, as it is believed it will be, the low-grade base ores of Washington Camp mean more to Pima county than all its other mining sections combined. At present it is only a matter of money and method of treatment.

NEW MEXICO.

ROLLS BY MAN POWER.—*Silver City Enterprise*, May 27: A return to the primitive method of crushing and concentrating the tin ores of Cornwall has been successfully tried at Central City by Harry McAllister. The plant consists of a pair of Cornish rolls driven by the aid of man power only. The capacity is two tons per day. The first run of 1400 pounds of light surface ores, carrying from \$8 to \$10 per ton in silver and about 20 per cent in lead, on being concentrated, assayed \$25 per ton in silver and 60 per cent in lead. The experiment thus far has been very successful and is a step in the right direction, besides demonstrating that the ores of Central City can be successfully and economically treated. The Texas, at a depth of 90 feet, not only holds its own with depth, but is gaining in value. The ore vein is continuous and is of the same general character which has paid for securely timbering the shaft, erecting a blacksmith shop, purchasing a whim and all expenses incident to mining, besides leaving a balance to the credit of the mine, a feature which rarely occurs in sinking a shaft. At 100 feet in depth, drifts will be run and the mine opened for extended development.

PINOS ALTOS.—Bell & Stephens started their mill on Monday, on Pacific ore. The teams of the firm have been employed for the last few weeks in freighting and getting their farms and orchards in shape for crop-raising. During this time a pan was fitted up in the mill and the old tailings from ores milled from the mine 25 years ago by N. Y. Ancheta and others were again run through, returning about \$9 per ton. As 20 tons per day were run through one pan with the labor of a couple of men, it proved a very profitable business.

ALHAMBRA.—Drifting has been commenced from the bottom of the shaft on the Alhambra mine at Alhambra. The vein matter encountered indicates the near approach to one of the rich native silver ore chutes so frequently found in this mine. The Hobson is showing well and will soon be shipping high-grade ore. Alhambra camp, so long known as Black Hawk, has been in a half-asleep and half-awake condition for the past two years, but is now awaking from its lethargic state.

OREGON.

AT CRACKER CREEK.—*Baker City Democrat*, May 28: After an idleness of about three years, the Eureka and Excelsior mines at Cracker Creek are to be operated on an extensive scale. A lease of the property by E. P. Cowen and others of St. Louis has been consummated, and the people of Baker county may now look for an advanced movement to take on in the mining districts southwest of Baker City. Under the lease of the Eureka and Excelsior mines, a new system for the treatment of ores will be introduced, and which will require an addition of machinery to the already splendidly equipped mill plant on the properties. The process of treatment will be what is known as barrel chlorination, and its success is assured, in the opinion of mining men. It is thought that Mr. Jonathan Bourne of Portland is one of the principal persons interested in the lease of the mines, as he has always shown a disposition to bring his company down to business. The machinery for the chlorination process is expected to arrive in Baker City by the first of the coming month.

AT CORNUCOPIA.—Mr. Estes stated that the Eastern Oregon Gold Mining Company, or better known as the Louisville, Ky., Company, Mr. Fred Stein, Manager, was preparing for an immediate resumption of operations on the well known Red Jacket mine, and a full force of miners will be set to work by the first of the coming month. The company is also taking steps to repair the tramway between the Red Jacket mine and the mill, which was the victim of several heavy snowslides the past two winters. With the working of the mine to its full capacity, the tramway repaired, the next step will be the starting up of the splendidly equipped 20-stamp mill and chlorination works of the company, which will occur, it is thought, about July 1st. The faith exhibited by the E. O. G. M. Co., in their investment in the camp, has now more than ever given encouragement to the mine owners of the camp generally, and there seems likely to be an advanced movement

taken on in the camp this season. The Simmons group of mines, which show wonderful richness and permanency, are to be operated quite extensively the present season. Mr. Lou Simmons, the principal owner of the group, has arrived in the camp and is arranging to put a force of miners at work further developing these mines. The Davis mine, owned by Mr. W. F. Davis, and the Last Chance mine, another of the valuable properties of the camp, are expected to resume operations as soon as the snow disappears sufficiently. The Last Chance is a great ore producer and will undoubtedly make a great record this season.

IDAHO.

SILVER CITY NOTES.—*Idaho Avalanche*, May 28: There are 19 men now employed at the Bleina tunnel. Water continues to bother, but good headway is being made. The ore body in the Trada Dollar looks very encouraging, and some large chunks are on exhibition at the office. The strike of gold rock in the Ontario, near the Black Jack tunnel, seems to be the absorbing topic this week. We have seen some of the specimens, and they are covered with the "yellow stuff." They have ten inches of it that will run up in the thousands. Henry Rendolph has located a placer claim in the center of town, between Washington street and Livery Stable avenue. Considerable interest is taken in the work on the claim by citizens. The Phillips and Sullivan shows up in great shape. The gold ore they are now stoping will easily average \$200 per ton, while the silver portion of the ledge looks fine. Surface water bothers them some, but in a few days will cease, as the snow will soon be gone. At the Black Jack tunnel, drifting on the ledge to the south continues, and they have passed the break in the gulch and the ledge has straightened out to its regular proportions and trend. Considerable quartz and ledge matter is coming in, and it is only a matter of a few more shifts till they cut the ore shoot.

MONTANA.

TO REBUILD.—*Butte Miner*, May 28: The greatest and best news with relation to Butte's principal industry, mining and smelting, was received from Boston last Monday, when orders were issued by the Butte and Boston Directors to rebuild the burned plant here. From the time of the fire until the order came to rebuild there was some apprehension felt among the people of the city, as it is a well-known fact that inducements were offered the company to re-erect the works at Great Falls. The construction work is now under way, and in less than six weeks the stacks will again begin to emit the old-time signs of prosperity; at the company's mines not much work is being performed at present, but it is only a question of a short time when full crews will be put on at each property. Development has been progressing, however, and by the time the smelter is ready for business the mines will be in better shape than ever before. On the Anderson, one of the company's claims, a shoot of rich ore was encountered a few days ago, and from indications it is likely to prove very productive.

BLUE WING SHUT DOWN.—At the Alice, the only change to be reported from a week ago is the closing down of the Blue Wing, which occurred last Thursday. The reason for this move is that the property contains a large quantity of very rich ore, and while it is the desire of the company to keep a portion of the works running, it is not the intention to work up the rich ore of the Blue Wing in so doing when the mill can be supplied from the Alice proper and the Magna Charta. The ore reserves of the Alice Company are quite large, and when the time arrives—which will be when silver recovers from its present pauperism—these reserves will be utilized. Everything about the mill and hoisting works is working smoothly, and the manager and employees are consequently happy.

WASHINGTON.

A MILL FOR THE TRIUNE.—*Okanogan Outlook*, May 28: Mr. James Lockwood returned Sunday from a trip to Spokane, where he went in company with Messrs. Schepstur and Sharpneck to close a deal with the owners of the Triune gold mine and Mr. Sharpneck, whereby the latter contracts to furnish and put up on the ground a complete ten-stamp mill for a third interest in the mine. Mr. Sharpneck has gone to Chicago to buy the machinery for the mill, which will be one of the best equipped of the kind in the country. The contract calls for a ten-stamp mill, with power and capacity for operating 20 stamps of 850 pounds each. The plant consists of a 50-horse power Corliss engine, ten 150-pound stamps, one rock-breaker, two automatic feeders, two concentrators, and electric light for mill and mine. An iron track will be laid between mill and mine and the ores taken in cars from the dump and emptied right into the hopper. As soon as it is demonstrated that the mill is a success, its capacity will be increased double or treble what it is at present, as the ore supply is almost unlimited. An idea may be gained of the extent of this ore chute from the fact that it has been prospected for 80 feet in width and 3000 feet in length. It is actually a mountain of ore, and some of it is exceedingly rich in free gold.

TO RESUME.—Preparations are being made to resume work on both Arlington and First Thought mines on Ruby Hill. A force of men was put to work this week building a wagon road from the Arlington down to Tunnel No. 3 of the First Thought mine, where large chutes are being built for the reception of ore from the different mines on the hill, and which will be carried by a bucket tramway to the mill below Ruby.

MECHANICAL PROGRESS.

The Edwards Tinning Machine.

The Edwards machine, recently introduced in Welsh tin plate mills, is thus described by a reporter of an English paper: The operation of dipping and rising tin plates is so mechanical that it is difficult to see how workmen can claim that any large degree of skill is required. The wet plates have under the present system to be taken singly, pushed down between the rollers, by which they are taken through the palm oil and tin (twice) by Mr. Edwards' first patent, and then on emerging, they have to be taken by the riser carefully with a tongs (so as not to disturb the tin before it sets) and placed on the cleaning tables. Except attention to the temperature of the bath little of human skill seems to be required. And now to the machine. There was, of course, the big iron base for the bath, in which, down out of sight, a series of continual rollers is fixed, so as to take plates right through the process mechanically. It is above this bath that the new machinery is fixed. At the end at which the plates are put in is a sort of huge "fork," with two actions. The wet plates are placed in two stand up piles within reach of one set of long prongs, which descend. These have "suckers" fixed at the end, which attach themselves to the corner of the plate, and lifting it, allow the air to go underneath, and so separate it from the rest of the pile; it thus drops into the bath, and the other set of prongs then descends and pushes it down till it catches the rollers underneath the oil. The other part of the invention is more complicated. By means of revolving clutches the tinned plate is seized, taken over the roller, when it falls automatically into a traveling rack, which conducts it to the cleaning table, where it precipitates itself. The whole thing struck me as being exceedingly ingenious, and, although I did not see it in active operation of turning out tin plates, it seemed to me to be quite likely to succeed in the object in view.

Testing a Lathe.

To test a lathe, the first operation is not to put the centres in line at a distance of from two to ten feet, according to the size of the lathe. Call it a small one, and let the test distance be three feet. Pick out a piece of shafting of this length, which is big enough to hang in the lathe without springing, say from two to three inches in diameter. Square up the ends of the piece, centre it nicely, and make sure that the centres are drilled deep enough that they will not bottom. Put a pin in one end of the test piece so that it can be put in the lathe without a dog. Then with a sharp tool turn a short space as close to the head end of the test-piece as possible, and if the tool can be set right, turn to the very end of the metal.

Then, without moving the tool, take the work from the lathe and turn it end for end. Then run the carriage down to the tailstock, put the work back in the lathe with ends reversed, and see if the tool—without being moved laterally—will cut the same as when at work at the other end of the lathe. It must be understood that the tool, when making this test, should be set exactly level with the centres, and not above or below sometimes operated.

If the tool will continue to cut so that the calipers show no variation in size of the work, then the lathe is in line. If not, the tailstock must be set over until the tool cuts the exact size started at the other end of the lathe.

When the above conditions have been met, remove the tool and put in one with a very fine point and adjust it so that it will stand at the exact middle of the end of the live centre. Then run the carriage back, knock out the live centre and put a stick three feet long in its place. Whittle down the end of the stick so it can be driven into the seat of the live centre and make the outer end of the stick smooth and square. Then run the carriage up till the tool just scratches the end of the stick. It should make a point in the end of the stick, and will if the lathe is true, otherwise it will describe a small circle. Next, run the tool out of the way and run out the tail-spindle until it touches the stick. If the lathe is true, the centre will go into the little hole made by the tool.

If out of truth, the direction of the tool-mark from where the tail-centre touches will serve as an indication of how much the lathe is "out," and which way the headstock must be moved to make things come right. The necessary adjustment must be done by scraping the vee on the under side of the headstock, so that the latter will be

twisted around square with the ways of the lathe. It is usually the case that corners, diagonally opposite, have to be cut away, and a good deal of care is necessary that the cutting is not done in the wrong place.

The stick used should be planed true, in some symmetrical form, no matter whether square, round or octagon, but it should be of such a shape that the bending or sagging of the stick from its own weight will be the same, no matter what side of the stick is uppermost. This would not be the case if a flat stick were used, but with either of the three shapes first mentioned the bending of the stick will do no harm, because it bends from all sides alike, when the different sides are brought uppermost by the turning of the spindle.

Lathe builders have a special rig made for this purpose, consisting of rigid metal bars, or light rods stiffly trussed for use in place of the wooden stick.—The Tradesman.

Steam Engine Efficiency.

At the recent meeting of the American Society of Mechanical Engineers in this city, a paper by Prof. C. H. Peabody, of Boston was read "On Economy and Efficiency of the Steam Engine." The author said that while it has been customary to state the performance of a steam engine in pounds of steam per horse power per hour, this method is open to objection, since the value of a pound of steam depends on the pressure and quality of the steam. The desirability of substituting the British Thermal Unit has been urged to the attention of engineers. This unit, sometimes called the pound degree, is the unit required to raise one pound of water 1° of temperature, or, exactly, it is the heat required to raise one pound of water from 62° to 63° F., and it is equivalent to 778 foot pounds. This method has a further advantage, inasmuch as it is applicable to any heat engine, such as a hot air or gas engine. The method of stating engine performances in British Thermal Unit is advocated because it affords a simple and correct way of finding the efficiency of the engine. The ordinary definition of the efficiency makes it a ratio of the heat changed into work to the heat consumed. Now, the horse-power is equivalent to 33,000 foot pounds per minute, equivalent to

$33,000 \div 778 = 42.42 \text{ B. T. U. per minute.}$ This constant divided by the heat consumed per horse power per minute will give the actual efficiency of the engine.

In order to show how well an engine is doing it should be compared with the performance of an engine which has no waste or losses—viz., with a perfect engine. If the cylinder walls of an engine could be made of some nonconducting substance, then such an engine could be made to work on the cycle closely resembling that of the perfect engine. The author then goes on to more fully explain the methods to be pursued in ascertaining the performance of an engine in British Thermal Units.

SLOWING PROPELLERS.—Damage to steamship machinery is often due to the rapid revolution of the engine when the propeller screw is thrown out of water by the pitching of the vessel. In order that the slowing of the machinery may be done in an automatic manner, an English inventor has devised an arrangement in which the sea water operates the controlling mechanism. The contact-making device consists of a tube in the stern of the vessel, connected with the sea, and having a float acting upon an electric coil. When the water about the stern of the ship is at a low level, and the screw is uncovered, the water in the tube flows out, and the float falls, and the electric circuit is completed. The current acts upon a distribution valve of a governor, admitting steam to one side of the piston, and partly shutting the throttle valve, thereby throwing the top and bottom of the low pressure cylinder into communication and equilibrium. When the water rises in the tube, and the propeller becomes immersed, this electric contact is broken and the controlling valves put back to their normal position.

FRICTION OF LUBRICATED BEARINGS.—At a recent meeting of the Leeds Association of Engineers, Mr. J. H. Wicksteed read a paper on the "Friction of Lubricated Bearings," founded on the researches of the Institute of Mechanical Engineers. After describing the apparatus used, the author began the discussion of the results arrived at, which, he stated, confirmed the deduction drawn from ordinary practice. With careful lubrication, steel shafts running in gun-metal bearings at from 50 to 300 revolutions per minute, would seize with the below mentioned loads: Collar bearings, 100 pounds per square inch; footstep bearings, 200 pounds per square inch; cylindrical

bearings, at 500 pounds per square inch; while a pin working intermittently will stand about ten times the above pressure without seizing. In all the experiments the surface was taken as being the diameter by the length. The lecturer pointed out that in the friction of the solids, the friction is directly proportionate to the load, while with liquid friction, *i. e.*, with a perfect lubrication where a film of liquid intervenes between the metallic surfaces, the friction is independent of load. The experiments showed that in a bearing with the load applied above, as in rolling stock, there was an upward pressure of more than 500 pounds, a hole being bored in the crown of the journal, and a pressure gauge inserted showing as much as 600 pounds pressure per square inch in a bearing four inches in diameter by six inches long. Thus a total pressure of upward of six tons was supported by fluid pressure of the lubricant, which pressure did not fall appreciably for half an hour after the experiment ceased. This film of oil would not exceed one thousandth of an inch in thickness.

SCIENTIFIC PROGRESS.

An Experiment with Aluminum.

A brief paper with the above title was presented at the San Francisco meeting of the American Society of Mechanical Engineers by Mr. W. W. Christie, of the Ramapo Iron Works. The author described two iron-aluminum alloys of great hardness, which were produced by him in experimental work. No practical use was ever made of them, and no further experiments were made to determine whether the alloys could be reproduced with regularity. The paper was of especial interest, because the general testimony of investigators is that the addition of aluminum to iron and steel tends on the whole to soften rather than harden the metal. (See *Eng. News*, March 1 and Oct. 11, 1890.) It is possible that the hardness of the specimens described by Mr. Christie was due to some other cause than the aluminum contained; but if the contrary is the case, the fact is a most important one and should be more fully investigated. We reprint the paper as follows:

The composition of the alloy was:

	No. 1.	No. 2.
Wrought iron turnings.....	10 lbs.	10 lbs.
Cast iron turnings.....	10 lbs.	5 lbs.
Steel rail chips.....	10 lbs.	15 lbs.
Ferro-silicate of iron and aluminum.....	2 lbs.	2 lbs.

"The melting was done by a well-known brass-founding firm in their brass furnace. In order to melt the mixtures, very high temperature was required on account of the wrought iron, which requires 3000°. So the crucible was covered with a carbon lid and coal heaped upon it. Even then about three hours' time was required to melt it, and after being melted, the ferro-silicate of the iron and aluminum, which has been left out, was added, and thoroughly stirred in. The castings made were 1½ inches diameter by 14 inches long, cast in green sand without any charcoal facing, and after the skin of sand had been removed from the castings, they were very smooth and clean.

"Mixture No. 1 was very fluid when hot and white, but had to be poured quickly, as it soon cooled. No. 2 was not as fluid nor as white as No. 1. No. 1 made a very homogeneous casting; No. 2 not nearly so much so, and its fracture duller than No. 1, which latter was very bright. It may also be said that pieces of both mixtures which have been on my desk since April, 1890, when they were cast, have retained their original brightness, which speaks well for the small percentage of aluminum in them.

"Mixture No. 1 could not be touched by a specially tempered cold chisel, the edge of which was destroyed. On No. 2 a tool maker used an hour's time cutting off but little, and during that time the tool required, I believe, five or six sharpenings. When heated to a high red heat, they both crumbled when struck with a hammer. When heated to a dull red heat, No. 1 was placed under a steam hammer, and though quite resisting, allowed itself to be flattened to about 1¼ inches thick before crumbling. It gave better results when annealed over one night. No. 2, when heated in the forge to a dull red heat, could be flattened to about three-fourths inch thick.

"A piece of No. 1 was remelted and cast into the usual shape for tension tests. This piece, though but 8½ inches long, was put in a Fairbanks testing machine, but as it was uncertain as to just how it would act, no extensometer was used for fear of the test piece breaking suddenly. Breaking occurred at a scale reading of 13,860 pounds. The piece broke, however, in the jaws of the machine, and in the larger section of the piece, as there was a flaw in it (cinder flaw). For fear

of breaking the jaws of the machine, the test ended here. After breaking the smaller section in the impact machine, the area was obtained by a planimeter as 0.31 square inch, which makes the tensile strength per square inch at the time of breaking 44,710 pounds. This would probably have been considerably higher but for the flaw and untrue grip of the jaws, which caused a combined transverse and torsional strain. The area of smaller section was less than that of the sound portion of larger section, hence its use. When placed on a Heisler impact machine, between supports six inches apart, a weight of 25 pounds falling 1¾ inches was required to break a circular section of 0.31 square inch."

Metals at High Temperature

Professor Roberts Austen, C.B., F.R.S., recently lectured at the Royal Institution upon "Metals at High Temperatures," says *Engineering*, of London. Professor Roberts-Austen pointed out that during the two hundred years which have just elapsed since the death of Robert Boyle, chemists have lamented the want of trustworthy instruments for measuring high temperatures. Wedgwood (1781) and Sir W. Siemens (1782) used almost the same words of regret as Boyle did in the seventeenth century. Siemens, by devising his electrical resistance pyrometer, did much to provide a suitable instrument which would afford trustworthy indications, and H. L. Callendar has since effected certain improvements in this pyrometer which have made it singularly delicate and accurate. The necessity for measuring the heat of comparatively small masses of metal led Professor Roberts-Austen to adopt a thermojunction of platinum and of platinum alloyed with 10 per cent of rhodium, devised by H. Le Chatellier, and later an iridium and iridium-platinum junction, capable of measuring degrees of heat up to 2000 degrees centimeter, which he had himself devised. By the aid of such instruments the lecturer showed the audience the point at which gold passes from its liquid to its solid state, or, in other words, the "freezing point" of gold, 1045 degrees, and of palladium, 1500 degrees. Professor Roberts-Austen then took three typical cases of the behavior of metals at high temperatures. The first is of much industrial importance and relates to the molecular structure of steel at great heats. He showed that on either side of a critical temperature of about 650 degrees, steel is practically two distinct metals, a matter of vital importance in the working of steel, for its neglect has been attended with disaster both to guns and ironclads. The second class selected by the lecturer had an important bearing on the true combinations which can exist between atoms of metals, and a newly discovered and beautiful purple alloy of gold and aluminum was shown to the audience, and it was pointed out that if the early chemists had known that the existence of this alloy was possible, and that the color of gold could be heightened to deep purple, the belief in alchemy would have been greatly strengthened. The third class comprises a statement of the evidence offered by dilute solutions of metals in a metallic solvent as bearing on rival theories of solutions generally, and the lecturer concluded by referring to the fact that the modern chemist strove as earnestly as the alchemists to change elements at high temperatures, and, by attacking their ultimate atoms, to produce transmutations which, as Boyle had said, "would be none the less real for being gainful."

RULING GRATINGS.—The *Optician* says a word should be said as to the difficulties of ruling "gratings" which may explain why so many orders for gratings remain unfilled. In the experience of Mr. Joseph Ames, it takes months to make a perfect screw for the ruling engine, but a year may easily be spent in search of a suitable diamond point. The patience and skill required can be imagined. Most points make more than one "furrow" at a time, thus giving a great deal of diffused light. Moreover, few diamond points rule with equal ease and accuracy up hill and down. This defect of unequal ruling is especially noticeable in small gratings, which should not be used for accurate work. Again, a grating never gives symmetrical spectra; and often one or two particular spectra takes all the light. This is, of course, desirable, if these bright spectra are the ones which are to be used. Generally it is not so. It is not easy to tell when a good ruling point is found, for a "scratchy" grating is often a good one, and a bright ruling point always gives a "scratchy" grating. When all goes well, it takes five days and nights to rule a six-inch grating having 20,000 lines to the inch. Comparatively no difficulty is found in ruling 14,000 lines to the inch. It is much harder to rule a glass grating than a metallic one; for to

all of the above difficulties is added the one of the diamond point continually breaking down. For this reason, Professor Rowland, who is an expert in their manufacture, has ruled only three glass gratings. One of them has been lost, and the other two are kept in his own laboratory. These two were used by Dr. Bell, the telephone man, in his determination of the absolute length of the *D* lines.

ELECTRICITY.

Developing Plants by Electricity.

The employment of electricity in horticulture forms an interesting subject for experiment and investigation, and results have already been obtained that justify the hope that the idea may soon be turned to practical account on a scale of considerable magnitude. Spring vegetables have already been forced by its aid for market, and there is no doubt that roses and other flowers can be made to bloom more plentifully and more profitably with its assistance. The Department of Agriculture at Washington has been experimenting in this direction for some time past. It has been found that lettuce is particularly susceptible to the influence of the electric light, by means of which, it is said, it can be grown for market in two-thirds the usual length of time. Other vegetables respond likewise in varying degrees. But everything depends upon the proper regulation of the light, and how to do this can only be learned by careful study of the results produced under all sorts of conditions. The effect of electricity being to hasten maturity, too much of it causes lettuce to run to seed before the edible leaves are formed.

Electricity is not employed for such purposes as a substitute for sunlight. It is merely used in a supplementary fashion. The greenhouse that has the sun in the daytime is illuminated at night with arc lights, toward which the plants incline their leaves and flowers. It has been supposed hitherto that vegetables required intervals of darkness for their health and development, just as animals need sleep, but it has been shown that, supplied with electric rays, they will go on growing thriftily between sunset and daybreak.

The electric gardener usually employs opal globes to diminish the intensity of the light. When the lamp is left bare and permitted to shed its unshielded rays upon the plants the latter grow pale, run up quickly in sickly stalks and soon die. It remains to be discovered exactly how much light is beneficial, and during precisely what period of development of the vegetables it ought to be applied.

The influence of the light upon the color and productiveness of flowers has been shown to be extraordinary. Tulips exposed to it have deeper and richer tints, flowering more freely and developing longer stems and bigger leaves. Fuchsias bloom earlier under like conditions. Petunias also bloom earlier and more profusely, growing taller and more slender. It is the same way with many other flowers. In fact, there is every reason for believing that the electric light will be very profitably used in future as an adjunct to forcing establishments for both flowers and garden vegetables. Already one market gardener in New Jersey is employing it with a success which he reports as marvelous.—*Western Electrician*.

NOT DANGEROUS.—The tendency to exaggerate the dangers of electricity has invariably been an accompaniment of its introduction for various commercial and other uses. We say exaggeration, for, when accurate statistics have been forthcoming, it has been found that electricity has not been such a "fell destroyer" as daily press articles have led us to suppose. It was so with electric light currents, and the same old cry has gone up now against the "deadly trolley" of the electric railway. The figures recently published by the city of Boston show how unfair this cry has been, and the fact that the trolley is not half so black as it is painted, for in one year the West End electric cars carried 119,000,000 people, which is many more than all the railroad lines in and out of Boston carry. In one year the number of deaths on suburban railways was 20. In the same year five people were killed by horse cars in Boston, and only three as a result of accidents by electric cars. But the cry will not cease yet. Our contemporaries of the daily press must have something to enlarge upon, and electricity is so mysterious. If they do not get the matter just right—well, the dear public don't know.—*Electrical Review*.

STOPPING ELECTRIC LOCOMOTIVES.—Heretofore, in electric railway work, it has

been largely customary to reverse the current in order to stop the car quickly, which results in a considerable waste and causes a tendency to burn out the motors. In order to obviate this difficulty, Mr. Sidney H. Short of Cleveland, Ohio, has devised an arrangement by means of which the motors are disconnected from the ordinary supply wire and connected in a local circuit with each other in such a way that the current generated in the local circuit and acting on a motor, tends to check the forward movement of the car. The two motors of a car are connected in the local circuit, so that the electromotive force of each under the rotation imparted by the forward movement of the car opposes that of the other and tends to produce a current in such a direction as to increase its own field magnetism and cut down that of the other. The car will thus be checked or brought to a sudden stop if running rapidly, and, if on a heavy grade, will creep slowly down without taking current from the supply wire and without having the brakes set. In effecting this, one motor overpowers the other, owing to the difference in the residual magnetism of their fields, and reverses the field polarity of the weaker motor, which is thereupon operated in such a direction as to run the car backward by the current from the more powerful motor, acting as a generator.—*Electric Engineer*.

STORAGE BATTERY WORK IN FRANCE.—Another attempt to reconcile the storage battery with the requirements of traction work is being made by a street railway company in Paris. The plan under consideration differs somewhat from the methods usually employed, in that the motor car is devoted entirely to the machinery and batteries, without carrying any passengers. These cars will haul one or two trailers. The motor trucks are peculiar in being composed of two wheel trucks, two of which are flexibly connected beneath the center of the car. The car body rests on rollers, one at each corner of the trucks, thus allowing the axles to turn through a considerable range and conform to the curves of the tracks without producing undue friction. The regulation of the car is effected by commutating both the motors and the batteries. The two motors are in series at starting, and are thrown in multiple for the second speed. The remaining speeds are made by the different combinations of the batteries. These are divided into four trays, and are used first, four in series; second, two in multiple series of two; third, four in multiple. These, with the two speeds of the motors, give four speeds for the car, the highest of which is only permitted outside of the city limits.

ON HEAVY TRAINS.—Electricity promises to be very extensively used for operating heavy railroad trains, particularly within city limits, where freedom from the smoke and gases, which are inseparable from a steam locomotive, is demanded. The success which has attended its use in street car work has attracted the attention of railroad managers, and already the engineers of the Wisconsin Central, the Illinois Central, the Pennsylvania and the Boston and Maine roads, are making exhaustive investigations of the various systems with a view to recommending to their lines the adoption of the one best suited to the heavy work which will be required of it. Two of the most eminent electricians in this country, Prof. Henry A. Rowland and Dr. Louis A. Duncan, have expressed the belief that, upon a carefully constructed road, electric cars could attain with safety, speeds which would not be possible with steam cars, the limit of safety being placed by them at 120 miles an hour. The practicability of using electricity for moving heavy freight trains will soon be satisfactorily demonstrated by the 22-ton electric locomotive which is being constructed at Whitinsville, Mass., and which is intended to haul six or eight freight cars of an aggregate capacity of 300 tons.—*Edison Monthly Record*.

MR. SIMS, one of the inventors of the Sims-Edison torpedo, has prepared drawings of a life-boat made on the same principle as the now famous torpedo. The propeller is to be placed in the stern of the boat, which is to be provided with three or four miles of cable and an electric search light. The current for propelling the vessel can be generated at a shore station several miles from the starting point of the lifeboat.

It is announced that the electrical decomposition of salt on a commercial scale is now being carried on in Switzerland. The company's works are situated near the river Orbe, and by utilizing a waterfall, 3,000 horse power is gained, and electrically transmitted to the factory, which is 300 meters distant.

GOOD HEALTH.

Milk Supply in Cities.

Wm. T. Sedgwick contributes to the *Technology Quarterly* an article from which we take the following:

Milk, to a great extent, man still uses much as his primitive ancestors used it; namely, in the raw or uncooked condition. And yet the milk of a modern city is altogether different from the milk consumed by primitive man. It is seldom fresh; it is often adulterated, and it is usually dirty. The stable, and travel more or less prolonged, have had their effect, so that the milk when delivered is often far along on its way toward decomposition.

Milk is an animal secretion prepared in much the same way as are the tears, the bile, the gastric juice, the urine, the sweat, and the saliva. It is secreted in the mammary gland, or udder, by certain epithelial cells which manufacture it from the blood. During the process of secretion these cells break open and contribute of their own substance to the mixture of water, salts, sugar, and fat, which constitute milk. At every milking a portion of the udder substance, the actual animal stuff, is given off; and thus it comes to pass that milk is strictly an animal food, like an infusion of muscle or of liver. It is unnecessary to say more to make it plain that it is highly unstable, highly decomposable, highly putrescible.

It is well known that milk, especially as it is found in large cities, is usually swarming with living bacteria. Most of these are probably harmless vegetables; nevertheless they constitute a host of organisms entirely foreign to the milk itself. The so-called "pure" milk ordinarily obtained in cities, even when it has not been tampered with, frequently contains in a teaspoonful millions of these microscopic vegetables, luxuriantly thriving in a soil most favorable for their development. Moreover, although themselves invisible, they do not fail to produce obvious effects. The souring and chemical decomposition of the milk, which soon appear, are due exclusively to their vital activity, and the milk which was originally sweet, and which in their absence remains forever sweet, becomes, owing to their activity, sour and chemically decomposed. In this condition it has important uses, but it is no longer "fresh" or "sweet" or "normal" milk. Under the worst conditions milk may actually be delivered to the consumer nearly or quite sour. That milk must be regarded as normal which is drawn from the teat of a healthy cow. In such normal, or udder milk, we have found no trace whatever of bacteria.

There are two principal sources of the bacteria in milk; namely, contamination during the act of milking, and the natural multiplication of the bacteria thus introduced during the interval between milking and the consumption of the milk. The result of these investigations was to show that even under the most favorable conditions, cow's milk as ordinarily drawn, becomes, almost necessarily, infested with hosts of putrefactive bacteria at the very outset. Under worse conditions, with unclean stables and dirty milkmen, to say nothing of half-cleaned pails and cans, it is easy to understand why milk swarms with bacteria; and if we allow time also, the wonder is, not that it contains so many germs, but rather that it is still potable at all.

When we reflect upon the indescribably filthy condition of many cow stables; upon the fact that the cow's udders and flanks are not infrequently covered with flaking excrement; upon the quality of the men employed to do the milking, etc., etc., it becomes a simple matter to understand how this rich animal fluid—sterile at the start, but drawn by unclean hands into half-cleaned pails, and meantime sprinkled from above by the dust of the stable, by hairs, dandruff, dirt, and particles of excrement from the skin and udder of the cow vigorously shaken by the milker or brushed by his hat—becomes infested with organisms. That these multiply swiftly and enormously in the warm and rich fluid, well aerated by the act of milking, is also a natural consequence of favorable conditions.

Tannin in Tea.

"Some examples which have been forwarded to us," says the *British Medical Journal*, "of the results of analyses for tannin and theine in tea indicate considerable variation in the amount of tannin, according to the quality of the tea and the state of growth at which it is picked. In some blends of China teas the percentage of tannin extracted by infusion for thirty minutes was 7.44; theine, 3.11; and a similar result was given in the examination of

the finest Moning; while, on the other hand, with fine Assam tea a percentage of 17.73 of tannin by weight was extracted after infusion for fifteen minutes, and two blends of Assam and Ceylon tea gave, respectively, 8.91 and 10.26 of tannin. On the whole it is probable that the Indian teas are much more heavily loaded with tannin than the China or Japan teas. Moreover, the common method of prolonged infusion in boiling water is well calculated to extract all the tannin, while it dissipates the flavor of the tea. To be drunk reasonably, tea should not be infused for more than a minute, and with water of which the temperature does not exceed 170° F. It should be taken without sugar or milk, which would drown the flavor of the delicate and aromatic infusion thus obtained. This at least is how tea is drunk both in China and Japan, whence we have borrowed the use of it. With our European method of prolonged infusion in boiling water we destroy all the best flavor of the tea, and we extract such heavy proportions of tannin as to cultivate indigestion as the result of tea drinking. Indigestion is unknown among tea drinkers in the East, and it is in all probability only the result of our defective use of the leaf."

USEFUL INFORMATION.

PETROLEUM FUEL.—Petroleum fuel for locomotives has been successfully introduced in South America, says *Engineering News*, on the Argentine Great Western Ry., native oil being used; but it is said that the supplies have given out, and the engines have once more to work with coal and wood. The petroleum deposits are situated in the province of Mendoza, and are the property of the Mendoza Petroleum Co. The crude oil, of a consistency resembling very coarse molasses, is brought down in a four-inch pipe to the works of the company, a quarter of a mile from the railway station, and is stored in a large tank reservoir, with a capacity of 3000 tons. It seems that the company has not carried its borings deep enough, and will have to make further sinkings to secure the constant supply which the deposits are expected to yield.

NEW ALUMINUM PROCESS.—M. Faure has recently invented a process of producing aluminum, by means of which he hopes to reduce its price to about 8d. or 9d. a pound. Briefly speaking, his proposed method consists in obtaining in a cheap manner, aluminum chloride, and decomposing it electrically. This decomposition can be effected with a smaller potential difference than can the fluoride now most frequently used for preparing aluminum by electrolysis, and at the same time a valuable by-product is formed in the chlorine liberated. It is said, however, that there are considerable difficulties in the way of making the proposed process a commercial success, which, it is feared, may prove insurmountable.

AN ELECTRIC MOUNTAIN RAILWAY.—An electric mountain railway is now approaching completion in Upper Savoy. The line starts from Etrembeieres, on the Bellegarde and Annecy railway, and runs in a circular sweep through Monnetier to Veyrier, a branch being run up the Grande Saleve. The gradients range from 16 per cent to 35 per cent, with curves ranging from 165 to 115 feet radius. The generating plant comprises three Thury dynamos, coupled to turbines. The motors are four-pole, each car being provided with two 33-horse power motors and two sets of gearing. Along the track inverted Vignole rails, supported on iron posts and brackets, form the electric conductor. A 15 per cent loss on the line is allowed for.

An ingenious apparatus for ascertaining the depths of rivers and smaller streams, has recently been successfully tried on the Elbe. It consists of a curved arm, hinged at the upper extremity, and of a length sufficient for the lower curved portion to trail on the bed of the stream. The greater the depth of the stream, the more will the arm be inclined, and hence by suitable recording mechanism the depth can be automatically registered.

A PROPOSITION to build three steel observation towers in Chicago—one in each division of the city—has been made by Mr. C. H. Merrill, and the Council Committee on Buildings has reported favorably on the erection of one tower as an experiment, which will probably be located in Lincoln Park. The tower is to be 350 feet high, 87 feet and 40 feet square at base and top, and the estimated cost is \$150,000. An elevator will carry passengers for a charge of 25 cts.

Mining When They Should Not.

A dispatch from Yuba City says: "Agents of the Anti-Debris Association of the Sacramento Valley have filed a report of their recent visit to the mining regions of Nevada, Sierra and Plumas counties. The watchmen found that there were 29 hydraulic monitors which have been worked this season, 11 of them being now in active operation, and none of them have made any attempt to restrain the debris, notwithstanding the decrees of the courts, the law and the promises on the part of the miners to abide by the decisions until Congress takes some action. In some instances, large quantities of earth are being washed into the rivers. Some of the mines are operated by Chinese, but these are in the minority."

We regret to be obliged to confess that there is much of truth in this report. Whether the men who have been working have all been duly enjoined we have no means of knowing; if any of them have not, then they break no law, since no general law against hydraulic mining has ever been passed. Under present conditions, each individual mine must be enjoined. When this is the case, and they persist in mining, the laws are broken.

And not only do these men violate the

decrees of the courts, but also the promises and pledges of the Miners' Association, which has been fighting their cause before Congress. They deserve and will get no sympathy whatever if they are heavily punished.

The California Miners' Association has no power over those miners who are not members, and is not even in a legal position to exercise control over those who are. It has endeavored in every way to impress upon owners of hydraulic mining property the necessity of obeying the decrees of the courts. Circulars have been printed and sent broadcast, and letters sent to individuals, urging the necessity of desisting from illicit mining in every way. The members of the Executive Committee have found this question the most difficult one they have had to handle, for there are plenty of men—in this business as in others—who will ignore decency, honor, promises and everything else for ready money.

It was long since recognized that it would be almost impossible to control these men when the water came in the spring. They have continued to work in the spring in years past before there was a Miners' Association, and some of them continue it now. The Anti-Debris Association must deal with them as it has before.

The Anti-Debris Association agreed to withdraw its "spies," or "watchmen," after the Miners' Association issued the circulars calling upon miners to stop mining until Congress settled this question one way or another. But as some miners have failed to obey this call, no one can blame the Anti-Debris people from again looking after their interests.

It is greatly to be regretted that there are men so blind to their own future interests as to persist in doing these acts at this critical period for hydraulic mining. The bill to permit the construction of restraining dams, having favorably passed the committee, is ready for the action of Congress. The miners are supposed to be quietly awaiting the result of this action. But here we find a number of them, totally ignoring pledges and promises, going on with work, and again arousing those feelings of animosity happily quelled for a space. They furnish their opponents a powerful weapon, and belittle their own association in the minds of the public.

A number of busy gentlemen have given their time and a number more their money to help the hydraulic miners resume work on a basis which will cause no injury to other interests. Yet some of the class so helped entirely ignore these efforts, do as they please, and jeopardize the whole industry for the sake of a few dollars. Of course they are "hard up," but they will be harder up still if they continue this sort of thing, for the next time they have a fight on their hands they will get no outside assistance at all.

But the public should understand one thing at least. This illicit mining is not being done with the connivance or aid of the California Miners' Association or its Executive Committee. The writer of these lines is a member of that committee and personally knows of the strong efforts made to stop it, and the earnest desire to keep and enforce the pledges made at the State Miners' Convention in January last.

The Editors and the Miners.

The editorial excursion party went up to Dutch Flat last week to see a hydraulic mine at work, and learn something of mining. On arrival there the guests were formed in line, with the band and Reception Committee ahead, and marched into the famous Gold Run hydraulic mine, which is owned by Gould & Doolittle. This is one of the largest and most valuable mines of this kind in the world, but has not been worked for nearly ten years, owing to the prohibition of that kind of mining.

The mine was put in full operation for

the occasion and for the first time in their lives most of the visitors saw the monitors at work. They had heard of the power of these devices, but when they saw what they really could do they were rendered almost speechless. The monitors were gayly decorated and painted for the occasion, one of them being named "The Editor" and the other "Governor Markham." They were throwing streams under 300-foot pressure against a high and frowning bank of cement gravel.

A regular miners' breakfast was set out for them, which they all enjoyed. After this they were shown the various methods of gravel mining. Some miners were at work with pans, others with rockers, toms and sluices. A typical miners' camp had also been arranged for the edification of the visitors.

The most interesting exhibit to them, however, was the hydraulic mining. After two hours' work the water was shut off and a clean-up made. The amalgam was retorted and the larger bar was presented to President Capeller of the association, by J. H. Neff, on behalf of the miners. Mr. Neff made one of his usual happy speeches. President Capeller in replying said he and his companions from the East had witnessed a scene that they could never forget. They never dreamed that California possessed such treasure beds. The fact that they had seen for themselves caused them to sympathize with the miners over their inability to wash the gold out, and he promised that each one of them would use his influence to secure for the miners legislation by Congress that will permit hydraulic mining to be resumed, without injury to the rivers or valleys. Mr. Capeller thanked the miners heartily for their generous gift.

The second gold bar was given to Governor Markham, through Colonel Bergin, one of the Governor's staff. The Colonel thanked the miners on behalf of the Governor.

From Dutch Flat the party went over to Grass Valley and Nevada City, where committees took them in charge, and they were royally received. The visitors were taken to the different mines and distributed so that all of the closer mines were reached about the same time. Those visited in Grass Valley were the Idaho, Peabody, Empire, Omaha, Lone Jack, North Star and W. Y. O. D. ("work your own diggings") mines.

At each mine the owners had made preparations for the visitors, providing refreshments of all sorts, and detailing men to show the excursionists around and explain quartz mining to them. Nearly every visitor was given some sort of a souvenir in the shape of a nugget, or specimen of quartz, and to say that they were delighted would be but half expressing it.

At 5:30 o'clock the Easterners reluctantly returned to their train and rode back to Colfax, the section from Nevada City closely following it.

At Colfax the Executive Committee of the California Press Association held a short meeting, and on motion of G. M. Francis the following resolution was adopted:

The last day of the National Editorial Association in California has been an exceptionally pleasant and profitable one by reason of thoughtful courtesies extended, and it is hereby resolved that the thanks of the association are due especially to Messrs. Gould and Doolittle of the Gold Run Mining Company for the excursion planned and so successfully carried out by them, with a view to acquaint the editorial mind of the Nation with California's system of hydraulic mining and the pressing need of such Congressional assistance as will permit this prosecution of that system of mining without detriment to the agricultural interests of the State; also for the breakfast generously spread and the happy illustrations of ancient and modern life in the mines prepared in Placer County for our benefit.

Resolved, Further, that the management of the Nevada County Narrow-Gauge Railroad Company has placed the fraternity under obligations for the delights insured to each member of our party by transporting it over their road through one of the grandest mountain regions of the Pacific Coast, and that the enterprising and great-hearted people of Grass Valley and Nevada City are entitled to be remembered most kindly for favors shown and generous hospitalities extended.

The Hale and Norcross Decision.

The decision of Judge J. C. B. Hebbard in the case of M. W. Fox vs. The Hale and Norcross Silver Mining Company et al. is a revelation to the masses.

That a judge could be found who, in the face of the strongest financial, political and social influences, would decide as he has done in this case, was totally unexpected. He has earned and should receive the everlasting support and thanks of a people who have been systematically robbed, and who now, for the first time, see dishonest millionaire conspirators called by their right names from the bench by an honorable and honest judge. An analysis of this decision indicates new departures in several directions—first, in the matter of the responsibility of the "directors" or "trustees" of corporations. It has always been claimed that "trustees" of corporations, acting for stockholders, were responsible to the shareholders in such corporations, but it has never been so plainly and so pointedly laid down from the bench as has been done by Judge Hebbard in this decision. In it he not only says that the trustees are liable civilly for losses which may be caused to stockholders by their (the trustees) inattention, neglect, or passive permission of fraud; but they are criminally liable as well.

Trustees will not find the formal attendance at meetings, and the drawing of their petty \$5 fee, such a pleasant duty, when they realize that heavy damages and a striped suit are awaiting them if they permit misuse, abuse, or needless waste of the trust property of which they have assumed the management.

There is still another point in this decision which particularly interests shareholders in the Comstock mines, and that is that the product of the "Little Joker" annex (which is attached to the mills on the Comstock to work over the tailings and concentrates claimed by the mill) does not belong to the mill, but to the owner of the ore. The system pursued at present on the Comstock (giving the residues to the mills) is simply equivalent to offering a premium for dishonesty on the part of the millman. No better proof of this can be given than the result of the test run of 110 tons of Hale and Norcross ore at the Occidental Mill. In this run they obtained 4,505 lbs. of concentrates which returned \$721.65 gross to the company, or \$288.66 per ton—the concentrates amounting to 59.78-100 per cent. of the total value of the yield; and this was only \$15 rock. Under the present system these concentrates go to the mill.

If the result of this decision will be the correction of the criminal mismanagement which is and has been the rule on the Comstock, and cause the cessation of the thievery practiced by the mill owners there, then it will have worked a miracle. If it does not, then there is the satisfaction of knowing that there is on the bench at least one judge who will continually punish those who have been guilty. There are grounds enough to pile the damages to the sky; sinews of war in the shape of money with which to prosecute the cases; and men who are willing to devote their time to the business.

If the millmen wish to avoid trouble in the future, they should do as the people have long wanted them to do, and that is turn over the mills to the mining companies who furnish the ores. Then there will be no questions about little jokers, annexes and concentrates. Apparently, at the present time, the possession of, or an interest in a mill on the Comstock is an almost sure proof of dishonesty.

It is impossible for us to give in detail a full analysis of this decision. It is bristling with brilliant points, and evidences by its clear, clean statements, a grasp of the evidence and of the facts and law in the case, which is superlatively complimentary to the writer of it, the Hon. J. C. B. Hebbard.

Chinese Mining Districts.

Continuing our description of the mines in China, attention is turned to the Chao-Yuen gold district, 25 miles from the steamer anchorage at Hung-Kou and 18 miles from the large town of Huang-Hsien. The topography, as shown in the engraving, is extremely rugged. The granite flanks of the Lo-Shan range rise out of the great Shanghing plain. The rise of the range is rapid, the culminating points, within a few miles of the base, being the Lo-Shan, at 2610 feet, and the Ying-Wan-Shan, at 2230 feet. The bedding of the granite has a general strike of N45E, and the quartz ledges, which are all apparently bed-veins, take the same general trend, varying from N30E to east.

No regular mining has been done, although prospecting has been carried on extensively. The best developed ledges are the Ling-Lung-Shan, the Hung-Chin and the Hei Shi-Yeh-Ting. The Ling-Lung-Shan is a large quartz ledge varying in width from 50 to 75 feet, with an east-and-west course, and a dip of 80° to the north. About 400 feet from the bed of the tunnel gave \$1.08 and \$1.38 in gold per ton.

Near the crest of Ling-Lung-Shan the ancient Chinese have done a large amount of work. In some places the rock has been quarried; in others they have followed a streak of ore from 2 to 3 feet wide for distances of some hundred feet; and in another they have made an immense underground working 100 feet long by 50 feet wide, and with an arched roof standing insecurely 30 feet above. Near by there are other places that were probably such cavern workings, but they have now fallen; 1500 feet west of the tunnel is the Hung-Chin series of ledges, bordering each side of a narrow ravine, through which a stream of water flows. On the east side a well-developed ledge of snowy white quartz, 6 to 8 feet wide and nearly perpendicular, has been opened. Several assays yielded \$1.28, \$3.35 and \$4.43 per

core rock, 2 to 3 feet thick, assaying \$27.77.

Ma-Ting lies one mile east of the tunnel and consists of openings in two parallel ledges of quartz, respectively 2 and 8 feet thick, and separated by a horse of granite 5 feet thick. These ledges strike east and

from hills thickly clad with pine, and a passable cart-road connects the mines with the sea-coast, 25 miles distant, affording easy transportation for machinery and, if necessary, for mineral-fuel. In Mr. Clark's opinion, these conditions make the Chao-

A Great Engineering Enterprise in Japan.

The last mail from the Orient brings a very interesting account of the completion and successful operation of a great government work in Japan. Lake Biwa, having an area of 500 square miles, is located seven miles from the City of Tokio and at an elevation of 143 feet. A navigable canal has been cut from this lake to Tokio, involving two miles of tunneling and an aqueduct of considerable length. At the eastern extremity of the city, to which point the canal has been brought, there is a sharp decline of 118 feet from the base of which the canal is continued to the sea. The difference in level is overcome by inclined-plane ways 2100 feet in length, on which boats are raised and lowered from one canal to the other. These ways are operated by electric power furnished from a Pelton water wheel connected with a Sprague motor.

The fall above-named affords also a very valuable water power—a part of which has already been utilized for various mechanical purposes, by means of electric transmission. The power station is located at the foot of the incline, and consists of three 8-foot and two 6-foot Pelton wheels, aggregating about 600-horse power, which are supplied with water from the high level canal by three lines of 36 inch pipe 1300 feet in length, delivering water to the wheels under a head of about 100 feet.

These wheels are at present operating three Edison dynamos of 80 kilowatts each, the power from which is distributed about the city within a radius of two miles; running rice mills, spinning mills, watch factory and various other machinery. One Thomson-Houston alternating current dynamo of 2000 volts supplies the city with 1300 incandescent lights, as well as many arc lights.

The above works—involving an expenditure of \$1,250,000—were planned by and executed under the direct supervision of Mr. S. Tanabe, an eminent Japanese engineer, and their operation is said to be a great success, both from a mechanical and financial point of view.

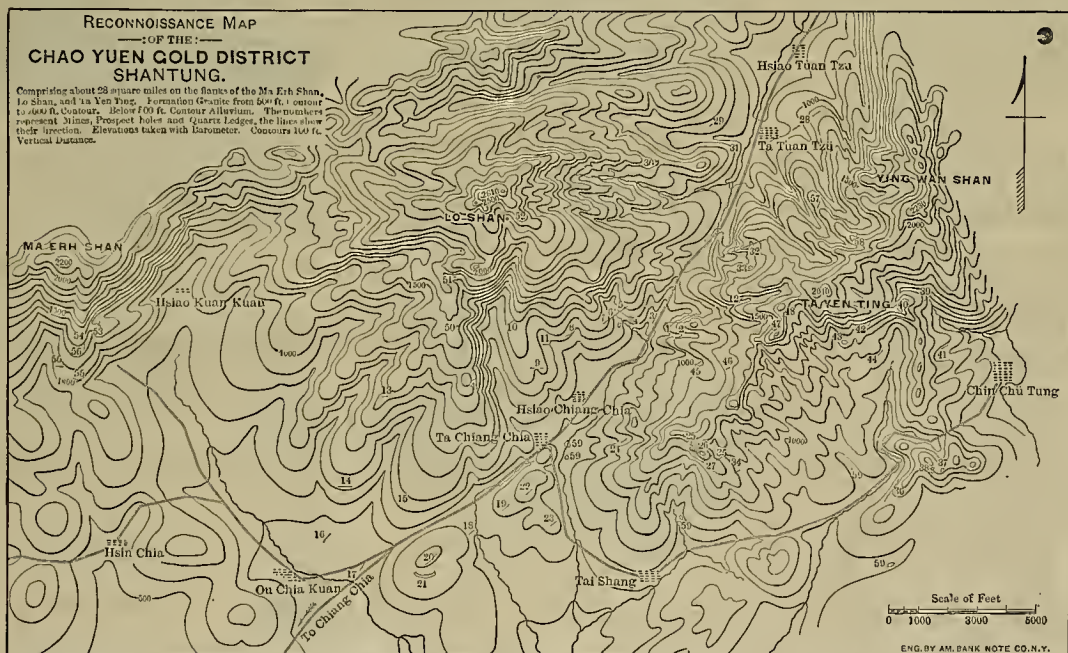

Sulphurets.

As a general proposition, the presence of much of a percentage of sulphurets in gold-bearing ore is a nuisance, entailing the expense of concentrating machinery and a subsequent chlorination process to get the whole value. The mills are nearly all equipped with concentrators to save the sulphurets. Many processes have been devised to work the sulphurets with the free ore at the same time, to save two treatments. The success of the MacArthur Forrest system in this direction is what is causing so much interest in this "cyanide process."

A man has lately been about this State to find "sulphuret mines," and strange to say, he does not find more than one or two with ore which contains enough sulphurets for his purpose. He wants it to have 30, 40 or 50 per cent sulphurets. These need not be worth more than \$15 or \$20 a ton, but the percentage of sulphurets must be high.

So the "glittering ore" for once is in demand. Any miners who own this class of mines may send word about them to the editor of this paper, and he will refer the letters to the proper parties. Do not be afraid if the stuff is all sulphurets; so much the better.

We have been reading and hearing for years of mines with ore so highly sulphuretted that no one could do anything with it. Now is the time for such mines to come to the front. Owners of sulphuret mines have had white elephants on their hands, and it may surprise them to find anybody who wants to hear about the ore or claims. But there are men prepared to work such ore, provided 40 or 50 tons a day can be obtained from a mine or group of mines.

ton. A continuation of this ledge on the west side of the ravine, known as Yu-Tzu-Tien, shows about the same characteristics and an assay value of \$4.43 per ton. Between these two openings is a vein, differing from the first ledge slightly in its course, materially in its dip, and decidedly in the character of its ore. It consists of about 18 inches of massive white pyrites, with a little quartz assaying \$8.10, and below this a tal-

west, and have a perpendicular dip. One assay gave \$15.17 per ton.

The average of 19 gold-ore samples taken from prospect holes of this district is \$5.86; and the average of ten samples, containing over \$2.50, is \$9.79, or nearly half an ounce to the ton. This is well within the working-limit, as the other surroundings are favorable. The location has sufficient water; an abundant and cheap fuel-supply is assured

Yuen region one of the most promising he has visited in China.

About 100 miles northwest of Peking, and 80 miles from the coast, is the Mongolian mining region indicated on the map printed last week as a shaded square. It comprises several distinct districts, which are shown more in detail on Mr. Clark's route map given herewith. These districts will be briefly described in the Press.

Irrigation Canals and Irrigation Works.

One of the most complete scientific treatises ever published in this State is that of P. J. Flynn, C. E., on "Irrigation Canals and Other Irrigation Works," and "The Flow of Water in Irrigation Canals," printed by George Spaulding & Co. of this city. It is a book for engineers engaged on works of irrigation, water supply, sewerage, land drainage, river improvement, etc. The work is divided into two parts, is illustrated and abounds in well arranged tables. By the use of the tables, any problem relating to open or closed channels, likely to arise in practice, can be rapidly solved. A great saving of time and labor can be gained by the use of the tables. There are 37 examples relating to open and closed channels, which will be of especial use to the student.

Tables 30, 31 and 32 give the velocity and discharge of a large range of open channels, and tables 68 and 69 give the velocity and discharge of circular and egg-shaped pipes, sewers and conduits.

At pages 8, 195, etc., is given the most complete collection of formulæ, old and modern, 69 in number; that has ever before been published, in a single work, in the English language.

The "Flow of Water" will be useful, not only to the irrigation engineer, but also to the engineer engaged on water supply, sewerage, drainage of land and improvement of rivers, etc.

The tables of contents of volumes 1 and 2, and the index of volume 1, are very full, and will enable the reader to find any subject referred to in the book, without loss of time.

Mr. Flynn is acknowledged to be one of the most accomplished mathematicians on this coast, and has had great practical experience in this country and abroad on irrigation and other engineering works. He is therefore perfectly competent to write authoritatively on this subject, and has evidently devoted great labor to his work. The typographical appearance of the book is exceptionally fine. Good ink has been used on heavy paper, and the table work skillfully done. The two volumes are bound in one book; price \$8, post free. The work contains 711 pages and 211 illustrations. This branch of engineering science, of such great importance to California and the Pacific coast, has been neglected by our writers until now. While Mr. Flynn has given much of what has heretofore been known, he has also added much that is original and of great value. Professional men will appreciate the labor bestowed on this book, especially on the table work.

About Gold Rock.

PRESCOTT, A. T., May 28.

TO THE EDITOR:—Will you please answer the following questions on gold rock for my information and that of others?

1. Is chromic iron present in iron pyrites where gold is present in the same?
2. Is chromic iron present in brown oxide and red oxides of iron that are found in veins of gold ore?
3. What are the general classes of iron which are found in gold ore?
4. Will a solution of iodine and iodide of potassa dissolve the black oxide, red oxide and brown oxide of iron?
5. Is the oxygen driven out of the oxides of iron by the solution of iodine?

Yours, J. W.

The following are the answers to the above questions:

1. No.
2. No. It may, however, be found as an accidental admixture.
3. Sulphurets and oxides.
4. No.
5. No.

VEINS IN AGRICULTURAL LAND.—J. R. Treloan has received a dispatch stating that the Supreme Court of the United States has reversed the decision of the lower court in the case of South Spring Hill mine vs. Median Mining Co. The lower court held that a mining company had no right to follow their vein into agricultural ground patented before the mine was located. The Supreme Court settles the point in favor of the mineral claimant.—Amador Ledger.

Cement Mortars.

In a recent article in the *Revue de Genie Militaire*, M. R. Feret remarks that in making cement mortar the sand is usually measured while the cement is weighed. This plan has many advantages in practice, as the cement is received in bags or barrels ready weighed, while it would be difficult to weigh the sand. Nevertheless, the amount of sand determined in this way is somewhat variable, as it will be more if measured in a small number of large measures than in a greater number of smaller ones. Moreover, the quantity contained in a given measure varies with the dampness of the sand. If but slightly damp, the amount of sand in a measure will be decreased, as much as 20 per cent in cases, when compared with the same sand measured dry. If, however, the sand is still further wetted, the reverse takes place, and the measure even contains still more sand than if measured dry, as the water brings about a compacting of the particles. The voids in a mass of sand vary with the regularity of the sizes of the grains. Were these perfectly uniform, the voids in a mass of coarse sand would be of exactly the same volume as in a similar mass of fine sand; but as in practice the grains never are uniform, each particular sand has a certain percentage of voids peculiar to itself, which one cannot do more than fill, no matter how large a proportion of cement is added in making the mortar. From the fact that natural sands are uniform, it follows that the many researches on the influence of the size of grain on the strength of a mortar have little practical bearing, as in such experiments the size of the grains is carefully calibrated by only using such as pass through one particular mesh and are arrested by a second finer mesh. The grains are thus rendered uniform in size and no longer correspond to natural sands. To further investigate the subject, M. Feret has prepared artificial sands out of crushed quartzite. The sand as received from the crusher was graded into three degrees of fineness. The first consisted of such grains as would pass through a sieve containing four meshes to the square centimeter, and were retained on a sieve of 36 meshes per square centimeter. The second consisted of grains passing through a sieve of 36 meshes per square centimeter and retained in one of a much finer mesh, while the third consisted of the grains passing this last sieve. Measured dry, each of these samples had practically the same specific weight, No. 2 being slightly the lightest. Mixed in various proportions, it was found the mixture having the highest specific weight was one consisting of six parts of the first sand and four of the third. This weighed 1686 kg. per cubic meter, or 30 per cent more than No. 2.

A Pump for Small Mines.

A novel and ingenious method of pumping water from mines has been invented by a resident of Walkerville, Mr. P. H. Hohmann. Mr. Hohmann is of an inventive turn of mind and sometime ago he patented a neat device which is now in operation near the terminus of the cable car line. This arrangement consists of a sliding lever by which the grip passes over the guide pulleys.

The pumping apparatus is known as a horse power whim pump. To an ordinary horse whim is attached a shaft connected to a disk wheel in the mine shaft. The apparatus at the bottom of the shaft consists of two cylinders connected on the under side with the suction pipe and on top with the discharge pipe. These cylinders contain two plungers connected by the piston with two walking beams. The upper walking beam connects with the disk wheel. The pump is worked on the same principle as a Cornish pump. The disk wheel connects with the shafting of the whim, and the rotary motion is derived by connecting gears. The disk wheel shaft and the whim shaft are connected at right angles by bevel gears. Each revolution of the whim causes the disk to rotate six times.

The disk works the walking beams and they in turn by a triangular motion work the plungers of the cylinders. These walking beams are light pieces of flat iron and are connected to each other by means of chains or wire rope.

This device will be of the greatest service to prospectors who are developing small properties. Every mining man is aware of the fact that the handling of water in mines is more expensive than the actual work of extracting the ore. The greatest feature of this apparatus is that no costly steam boilers or pumps are required. A one-horse whim will operate a mine 200 feet

in depth and will pump fifty gallons of water per minute.

One of these whim pumps is now in practical operation at the Blackstone mine, north of Walkerville. The device is owned by Col. Wilson and Mr. Hohmann, and will be placed on the market as soon as satisfactory arrangements can be made with some manufacturing concern.—*Butte Inter-Mountain*.

Curious Actinic Phenomena.

It has been shown by M. Rayet (Academy of Science, Paris) that the moon can be photographed when fully eclipsed, that is when it is entirely plunged in the shadow of the earth. This curious fact is explained by supposing that the surface of our satellite retains a certain amount of actinic power after it is withdrawn from the rays of the sun, or that some solar rays reach the lunar surface during a total eclipse by refraction. Many substances do retain actinic power after they are withdrawn from light, and M. A. Gautier has recently shown that a mixture in equal volumes of chlorine and hydrogen will explode in 20 or 30 seconds when placed in the shade at a spot which the sun has recently lighted up. Several curious phenomena of the same description have been described in Phipson's "Phosphorescence," in 1862, where it is shown that paper impregnated with tartaric acid and exposed to sunlight, will act upon photographic paper in the dark, etc. It is a curious fact that chlorine and hydrogen, which have been obtained by the electrolysis of hydrochloric acid, will explode together in diffuse daylight, which only affects the two gases obtained by the ordinary laboratory methods very slowly. M. Gautier has called attention to another singular fact. If hydrogen gas is mixed with chlorine gas which has previously been exposed to sunlight, the mixture will explode instantaneously in the dark. This phenomenon was observed long ago by the late Dr. Draper of the United States. It is evident from these observations that substances which have been submitted to the action of electricity, or which have been exposed for a certain time to the direct rays of the sun, are in a peculiar state of excitement, which renders them much more active as regards one another than are the same substances prepared by the ordinary methods of the laboratory. Under these circumstances they acquire a peculiar allotrophic state, similar to what ozone is as regards ordinary oxygen gas. The surface of the moon, when totally eclipsed, is not absolutely invisible to the eye, and it radiates sufficient actinic light to enable a photograph to be obtained in a short time on the modern sensitive plates.

ENRICHING COAL GAS.—At a recent meeting of the Scottish Gas Managers, Mr. T. Douglas Hall, in the opening address, referred to oil gas as follows: "It is affirmed that if you pass oil gas through a heated retort, and then allow it to mix with the coal gas as it is being generated, a permanent gas is obtained; and also that the finer the spray of oil that is formed the better are the results, the oil being so much easier decomposed. Compressing, therefore, to a high degree, would, in these circumstances, be of great advantage. Hitherto the success with oil as an enricher has been varied, but as the process is new, comparatively speaking, let us hope it is capable of great development. That the manufacture of oil gas is a success we see every day in railway carriages and gas-lit buoys. A process for making a very rich gas is at present being put forward by a Manchester company calling itself the Hydro-oxy Gas Company, and it is claimed that this gas can be used for enriching ordinary coal gas."

MIXING ARTIFICIAL WITH NATURAL GAS.—The Michigan Gas Company, of Detroit, Mich., will soon begin the manufacture of fuel gas. The company proposes to make use of artificial gas in supplying its customers with fuel. It will be supplied in the proportion of 1000 artificial to 2000 parts of natural gas. This, of course, will greatly reduce the drain on the natural gas wells. The capacity of the new manufacturing plant to be put up by the company will be 2,000,000, with a reserve of 4,000,000 if needed. The most modern appliances will be used, and the gas may be produced at a much cheaper rate than at the present time. Am. Manufacturer.

CAMPBOR GUM.—Complaint is made at the present high price of campbor gum. While a few years ago the gum sold for 19 to 25 cents a pound, it now sells for from 55 to 75 cents. This rise in price is due to the use of campbor gum in the manufacture of smokeless powder both in Europe and America.

Gas and Gasoline
ENGINES
Have fewer parts, and are therefore less likely to get out of order than any other gas or gasoline engines now built. Just light the burner, turn the wheel, and it runs all day.

MAKES NO SMOELL OR DIRT.

No double or false explosions, so frequent with the unreliable spark,

For Simplicity It Beats the World.

It Oils itself Automatically.

No Batteries or Electric Spark.

It runs with a Cheaper Grade of Gasoline than any other Engine.

COLUMBIA, CAL., Dec. 15, 1891.

Messrs. PALMER & REY, San Francisco, Cal.
DEAR SIR: Yours of the 9th to hand. In reply will state that the one-horse power Gasoline Engine I got from you has been running every day, for the past three weeks, and has given entire satisfaction. It is placed in a tunnel full 300 feet from the surface, and is hoisting ore from 100 feet below that. It does all you claimed for it, and is the best and cheapest power that has been in or about a mine. A number of mining men in this locality have viewed the machine in operation, and they all pronounce it a perfect success.
Yours truly, F. L. McPHERSON.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

Price of 4-foot wide Plain Belt Frue Vanner..... \$550, f. o. b.
 " " " Improved Belt Frue Vanner 800, f. o. b.
 " 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

CLADSTONE MINING COMPANY, C. J. Clark, M. E. Genl. Sup't. MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, require no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have to my mill.
 C. J. CLARK, Gen'l Sup't.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO.,
 No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
 Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin it need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
 39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company, Principal Office, 401 California St., cor. Sansome, S. F. Location of Works, Grass Valley, Nevada Co., Cal. GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed) Sup't North Star and Original Empire Mining Co. N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

PRICE, \$675, f. o. b.

Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge.

THE SAN JACINTO ESTATE—Office of the General Manager, CAJALCO, Oct. 30, 1891. GEO. E. WOODBURY, Esq.—Dear Sir: In reply to yours of the 27th inst., respecting the working and efficiency of the "Woodbury" Concentrator placed in our works by you, I am pleased to inform you that it is giving entire satisfaction; it has a much greater capacity than any other machine, and is doing fully one-third more work, with the concentrates equally clean, as from either of the machines it work here. (Copy) Yours faithfully, S. HARRIS, Manager. THE SAN JACINTO ESTATE, LINDSEY—Office of General Representative, P. O. address, South Riverside, San Bernardino County. CAJALCO, February 17th, 1892. GEO. E. WOODBURY—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully, S. HARRIS.

GEO. E. WOODBURY, Man'fr, 213 to 219 First St., San Francisco.

PATENTED, Aug. 19, 1890.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that could otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

IRON
PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,
ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal iron of great tensile strength.
The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe
in a bath containing a special mixture of ASPHALTUM, BITUM and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalis of the earth, rust, etc., and is practically indestructible.

An Anti-Mining Convention.

A mass meeting was held at Colusa on Saturday, by farmers and citizens, and resolutions were adopted protesting against the passage by Congress of the hydraulic mining bill. The resolutions declare that the position of the farmers and other citizens of the valley on the subject of hydraulic mining by means of the system of impounding dams, has been misrepresented at Washington and elsewhere, and that the farmers have never admitted in any shape that they were willing to make concessions, but that they have stood and still stand squarely upon the decisions of Judge Temple of the State court and Judge Sawyer of the United States Circuit Court. The resolutions say: "It has been held after years of experience, that hydraulic mining is destructive of our rivers and the Sacramento valley; that if said form of mining is to continue, the navigation of the rivers and farming in the valley must be abandoned; and that there is no compromise on impounding dams, for that method has been persistently rejected by the inhabitants of the valley."

A convention of citizens of Tehama, Butte, Glenn, Colusa, Sutter, Yuba, Yolo, Sacramento, Solano and San Joaquin counties has been called by this mass meeting, to be held in Sacramento on June 10th, to consider the questions which are involved in the Colusa resolutions.

As the bill in Congress authorizing the building of dams to restrain the debris is on the eve of passage, it was to be expected that some opposition would be manifested on the well-known California principle of not letting any other Californian get anything if it can be helped. The miners do not ask to be permitted to work unless they can do it without injury to other interests; any other idea has long since been given up.

The farmers know nothing whatever about impounding dams. That is a matter out of their line altogether. The Government engineers have decided in favor of the dams, and their opinion is of more moment. The farmers might at least let the plans be tried, and give the miners a chance to make a living. But it is too much to expect that this question should be settled without more controversy; so we must again see two industrial classes arrayed against each other.

The Fulton Iron Works Fire.

On Sunday morning last the principal part of the block bounded by Howard, Folsom, Fremont and Beale streets was destroyed by fire. The heaviest losers are Hinckley, Spiers & Hayes of the Fulton Iron Works, whose entire plant was destroyed—the second time they have so suffered within five years. The California Car Works of John Hammond & Sons were also burned, as were Greenberg & Sons' Brass Works and Drake's machine shop. The fire at the Fulton, in 1887, was confined to the machine shops, but this time the whole works are wrecked. All the tools are ruined, and many valuable drawings, etc., destroyed. The insurance does not come anywhere near covering the loss, which is estimated at \$300,000 for the Fulton alone.

The buildings destroyed were within the fire limits, and if rebuilt wood cannot be used. It is not probable, therefore, that the same location will be used. There is some talk of the Fulton taking the old Pacific buildings now occupied by the branch Union Works. The firm has not yet decided on its future course. These works were the third largest in the city, ranking next the Risdon. Every one regrets the misfortune which has overtaken this firm, which is a very popular one, and the hope is generally expressed that operations will be resumed at once.

ENCOURAGING reports come from the oil fields in all parts of Southern California. Both Kern and Humboldt counties also are doing well with oil.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 24, 1892.

- 475,375.—MICK PAIL AND STRAINER—F. & G. W. Ausley, Medical Lake, Wash.
475,655.—CRUPPER STRAP FASTENER—F. L. Armas, Pescadero, Cal.
475,377.—SOLE IRONING TOOL—Atwood & Orcutt, San Francisco.
475,433.—BRICK KILN—M. A. T. Boehucke, Centinela, Cal.
475,485.—CLAY REDUCER—W. Buckman, San Francisco.
475,497.—FRUIT GRADER—J. A. & C. F. Fleming, San Jose, Cal.
475,317.—MUSIC LEAF TURNER—C. H. Huff, Tropico, Cal.
475,451.—WAVE POWER—R. L. Johansen, Los Angeles, Cal.
475,454.—COATED METAL PIPE—W. Lacy, Jr., Los Angeles, Cal.
475,406.—HOSE COUPLING—J. E. Louthian, Etiwanda, Cal.
475,706.—CAR COUPLING—S. Q. Sanders, New Bridge, Or.
475,743.—COIN CONTROLLED APPARATUS—G. F. W. Schultze, San Francisco.
475,360.—AMALGAMATOR—J. M. Thompson, San Francisco.
475,641.—VOTING BOOTH—I. D. Vandecar, Stockton, Cal.

The following brief list by telegraph, for June 2, will appear more complete on receipt of mail advices:

- San Francisco—Mark Anthony, Berkeley, means for protecting bungee of barrels; Edgar B. Badlam, carburetor; James W. Kinsman, hoisting apparatus; John Hummers, horse hoot.
California—John A. Bliz, Pleasanton, two-wheeled vehicle; Walter L. Frazier and Walter E. Brown, National City, adjustable spindle nut; Michael N. Laufenberg, Stockton, finger bar; Isaac W. Lord, Cucamonga, indicating funnel; Thomas A. McGovern, Bolinas, oil gauge for lamps; Dennis W. McLaughlin, San Leandro, combined weighing and advertising device; David M. Miller, Fairfield, car axle; Frank White, Pomona, snap hook; Daniel T. Woodman, Blackburg, horse-controlling device.
Oregon—Gustaf E. Hadlund, Portland, boot or shoe.
Washington—Patrick Curran Hoquiam, swimming equipment; James W. Fisher, Palouse, water supply system; Legrande D. Harding, Colfax, grinding mill; Raymond L. Palmer, Tacoma, safety lock for hammerless guns.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors, transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

OPERA CHAIR.—John T. McKean, Santa Rosa, Cal. No. 475,019. Dated May 17, 1892. The object of this invention is to provide an opera chair, the seat and back of which may be folded into a parallel vertical position when not in use, and the seat-supporting standard is automatically rotatable about its socket in the base or floor, so that when the seat and back are thus folded together and vacated, the whole device will immediately turn a quarter revolution, thus forming passages between the seats from front to rear, as well as transversely, which greatly aids the occupants in vacating the house after the performance. The seat standard may fit a socket plate in the floor and be made easily removable, so that if it is desired to clear the floor of the house for any purpose, the seats can all be easily taken out.

COMBINED CARD LEDGER AND INDEX.—John A. Langstroth, San Francisco. No. 475,043. Dated May 17, 1892. The invention is designed to provide a simple and expeditious means for keeping accounts and indexing them, so that they can be rapidly found and examined, and closed accounts may be removed, and new accounts continually inserted, at the same time retaining a proper alphabetical arrangement of those accounts, while saving the time and labor usually expended upon the keeping of an index. Where an ordinary ledger is made, with a large number of accounts, these accounts are written in the ledger from time to time as they occur, and an alphabetical index (upon which all the account names, as well as ledger and folio have to be entered) is necessary in connection with such ledger. Much time is lost in examining the index to find the accounts, and in turning over pages of the ledger for any work that is necessary to be done upon the open accounts, by reason of the ever increasing number of closed accounts. This invention is designed to save the labor of indexing and the time and labor of handling and inspecting the closed accounts, all the time and labor spent in opening new or transfer ledgers for old accounts, and the time usually spent in referring to an index by the ordinary method. The accounts are kept on a series of separate and independent cards, in perfect alphabetical order, with guide cards of the same size interposed between them in such a manner that they serve as index cards and also adjustable supporting partitions.

SEPARATOR.—F. H. Wheelan, Santa Barbara. No. 474,930. Dated May 17, 1892. The general object of this invention is to provide for the separation of material particles composed of different sizes. The particular object is to separate the particles of dirt or imperfect specimens from grains and seeds having greater length and breadth than thickness, such, for example, as Lima beans. It consists in a mode or method of separating materials composed of

particles of different sizes, by carrying the material upon a suitable moving surface toward a succession of graduated openings, and drawing them up and upon said surface, through said openings, as their sizes will permit. It also consists in a mode or method of separating materials of different sizes having a greater length and breadth than thickness, by carrying the material upon a suitable moving surface toward a succession of graduated openings, and presenting the particles edgewise to said openings and drawing them up and upon said surface, through said openings, as their different thicknesses will permit. The machine also finally keeps separate the different sized particles which pass through the graduated openings.

DESIGN FOR AN ENGINE FRAME.—Daniel Best, San Leandro, Cal. No. 21,545. Dated May 17, 1892. This invention consists of a novel design especially adapted for a frame and bed-piece of gas engine. The leading feature of the design is the peculiar outline of the frame upon which the cylinder rests, the two merging into each other, the frame having a peculiar trough shape, extending from the cylinder to the end where the crank shaft has its support, together with downward projecting legs or supports at each end and an arched under-body.

FRUIT PITTING MACHINE.—Frank C. Staniford, Gilroy, Cal., assignor of one-half to D. C. Riddell, Santa Cruz, Cal. No. 475,048. Dated May 17, 1892. This is an improvement devised for removing the pits from peaches, apricots and similar fruit. It consists of a table, with guides, and overlapping knives, and mechanism by which said knives are caused to reciprocate to and from each other, and the fruit-splitting table situated beneath and between the meeting ends of the knives; said table being depressible to bring the fruit into line with the knives; and automatically returned by a spring when released. It is well known that in order to make a merchantable article, all such fruit as peaches, apricots, etc., must be split in the direction of the major axis, the longer diameter of the fruit and the stone, and no automatic means have been devised by which the fruit can be accurately placed in this position without other assistance. By this device the operator can readily place each fruit beneath the knives, and a basket of fruit can thus be pitted in five or six minutes, the fruit being turned out in good merchantable condition.

VOTING BOOTH.—Israel D. Vandecar, Stockton. No. 475,641. Dated May 24, 1892. Under the plan known as the Australian ballot system, which has been adopted in many of the States of the Union, it is requisite that the voter have a booth or compartment to which he may retire for the purpose of preparing his ballot in secrecy. The object of this invention is to provide such booths in a form which will render them easily portable in the smallest possible space and readily set up at the points where they are to be used. This is important, because in thinly settled districts it is often necessary to carry the paraphernalia for election purposes to distant precincts, often over rough roads, and in any event, it is desirable to have the apparatus safely stored and packed away when not in use.

CLAY REDUCER.—Walfrid Burkman, S. F. No. 475,483. Dated May 24, 1892. The invention relates to the general class of machines for reducing and disintegrating clay, feldspar and other similar materials in a dry or semidry condition. The object is to provide a complete and efficient machine adapted to receive the material in the crude shape and deliver it in any condition of fineness required, combining in its operation that of crusher and reducer, the material passing through it constantly and automatically, and having a storage sufficient to keep it steadily working while new supplies are being brought.

FRUIT GRADER.—Geo. A. and Chas. F. Fleming, San Jose. No. 475,497. Dated May 24, 1892. This is a machine for grading fruit and other materials composed of particles or pieces of different sizes. The object of the invention is to provide a grader of great capacity, simple in operation and accurate and effective in results.

CRUPPER STRAP FASTENER.—Fabricio L. Armas, Pescadero. No. 475,655. Dated May 24, 1892. The object of the invention is to provide a fastening for the meeting ends of harness straps which will enable the operator to secure these parts together with rapidity. The device is especially useful upon crupper straps, which it is often difficult to properly secure upon young or timid horses.

CABLE RAILWAY GRIP.—J. C. H. Stnt, San Francisco. No. 474,875. Dated May 17, 1892. The object of this invention is to provide a grip having one fixed and one movable jaw, and a means for operating the movable jaw. These jaws being so arranged with relation to each other and the cable as to allow the latter to be set a considerable distance to one side of the vertical plane, passing through a slot and parallel with the top of the cable tube.

SAFETY WATCH POCKET.—H. A. Liedel, Haywards, Cal. No. 475,017. Dated May 17, 1892. The object of this device is to prevent a watch being snatched or surreptitiously removed from the pocket and stolen. The invention consists in a casing of camoils or other material adapted to be inserted within the pocket of the wearer to receive the watch, said casing having a spring effectually binding and holding the watch in place. The object of the invention is to provide a simple device for receiving the watch, into which it may be readily slipped and as readily removed by the owner, but which will prevent it from being forcibly dragged out or even slyly removed by another person.

Powerful Turbines For Niagara.

The immense new pulp and paper plant of the Cliff Paper Company at Niagara Falls are to be supplied with late new designs of the horizontal shaft, double discharge, James Leffel wheels, built by James Leffel & Co., Springfield, Ohio. The contract for this work was signed by the Cliff Paper Company and James Leffel & Co., on the 13th of May; after this Cliff Company had made a full and careful investigation of the merits of various wheels presented during the past year for their consideration. Each of these turbines is to be 1100 horse power capacity; and built essentially upon the plan of their style No. 23, illustrated in the pamphlet of James Leffel & Co. These wheels will connect directly to the pulp grinder shafts at each end of the wheel shafts, without belts or gearing.

This water-wheel company has celebrated its thirtieth year of continuous business in this line of work. They have added many improvements to their James Leffel Wheel in the past two years; and have designed a large number of new styles, incorporating in them the best ideas of their large experience. The manufacturing plant of this company has also been recently greatly extended, and various pieces of new, improved and heavy machinery added; all adapted to the heavy water wheel work they are now manufacturing. They shipped, some time since, one James Leffel wheel and casing weighing 45 tons; also filled one order for 19 large wheels for one pulp and paper company.

Ramie Manufacture.

SAN FRANCISCO, 810 Castro St.,
May 16, 1892.

TO THE EDITOR:—The Department of Ramie Culture has been named by the State to have the ramie plant successfully introduced in California if possible. By correspondence, Mr. Walter T. Forbes of Atlanta, Ga., was invited to visit our State. He came, and has invested over one thousand dollars in machinery, to fully demonstrate that he can clean ramie fiber that has been decorticated and furnished him in ribbons.

Several trials of his "Patent Digester" were made in the city of San Francisco at cor. Eighteenth and Shotwell streets. Samples of the fiber so degummed were sent to the San Jose Woolen Mills by the undersigned to test the practical working. White blankets containing half ramie and half wool were manufactured. They looked fine and soft, and no doubt will be strong and durable. Also cloth was made for gentlemen's suitings, which was good looking for spring goods, being of equal parts of ramie and wool. Much credit must be given to the enterprising manufacturers of the San Jose Woolen Mills for demonstrating the use of ramie in this manner. They say the fiber is good and works well on the machinery and blends finely with the wool, no trouble being noticeable.

W. H. MURRAY,
Supt of Ramie Culture for California.

THE LATE J. J. REY.—The well-known pioneer lithographer, J. J. Rey, died at his residence in this city from inflammation of the bowels, after a brief illness. Mr. Rey was a native of Alsace and was born in 1820. He came to California in 1852 and soon afterward located in this city. He entered into partnership with Joseph Britton in 1855, and since that time the firm of Britton & Rey has been actively engaged in the lithographing business, nearly all the early maps of San Francisco bearing their imprint. The deceased leaves a widow and several children and a large circle of friends.

THE miners that left Duluth for Oeur d'Alene were intercepted at Butte by the labor organizations and induced to return or remain at Butte, greatly to the encouragement of the Idaho striking miners. The Poorman mine has been ordered to resume work at union wages, which also pleases the miners. The Oeur d'Alene district is no place for miners to go to just now.

THE Calaveras county miners are organizing. On last Saturday a preliminary meeting was held at San Andreas. I. H. Ried presided. A committee of twenty-five was appointed to draft by-laws and constitution and to report to an adjourned meeting to be held June 11th. The committee was selected from the most prominent mining men in Calaveras county.

THE members of the Astronomical Society of the Pacific hold their meeting June 11th in the library of the Lick Observatory, Mt. Hamilton. Six papers are announced.

Founded by Mathew Carey, 1786.

DEWEY & CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 220 Market St. S. F.

Address ROWELL'S ADVERTISING BUREAU, 108 Spruce St., N.Y.

If you wish to advertise anything anywhere at any time write to GEO. P. ROWELL & CO., No. 10, Spruce St., New York.

F. A. HUNTINGTON, PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

F. A. HUNTINGTON,

MANUFACTURER AND DEALER IN

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

OFFICE AND WORKS, 213 TO 219 FIRST STREET, SAN FRANCISCO, CAL.

EMBRACING IN ITS
VARIATIONS OF
CONSTRUCTION
AND APPLICATION

THE PELTON
SYSTEM OF
POWER

THE PELTON WATER WHEEL.

The most distinctively new and important development relating to hydraulic power that has been made in the last half century. Adapted to all conditions and every variety of service where a head of 20 feet or more can be obtained. **OVER 2500 IN USE, AGGREGATING NEARLY 300,000 H. P.** Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 to 2000 or more feet. Much better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC POWER TRANSMISSION. The advantage the Pelton Wheel affords to the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. **SEND FOR CATALOGUE.**

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.
143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, varying from the fraction of 1 hp to 100-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. **SEND FOR MOTOR CIRCULAR.** Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates. The great success that has attended the introduction and operation of the Pelton Water Wheel has led to many imitations and some infringements of the various patents of this company. Intending purchasers are hereby warned that all such infringements will be vigorously prosecuted, and that the users of wheels so infringing, as well as the manufacturers, will be held equally responsible.

THE GATES ORE AND ROCK BREAKER.

Unlimited in Capacity; Unequaled in efficiency. **UPWARD OF 3000 NOW IN USE.** Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without additional expense. Best and only Crusher adapted to Macadam Road Work. Send for Circular.

Air-Compressing Machinery.

In the MINING AND SCIENTIFIC PRESS of May 14th we gave illustrations of the concentrated piston inlet cold-air cylinder, air inlet valve and automatic regulator and unloading device used in the Ingersoll-Sergeant air compressor. These are very important improvements in air-compressing machinery. The free air, before admission

power or attention on the part of the engineer.

On this page is given a view of the Ingersoll-Sergeant duplex Corliss air compressor, with compound steam cylinders and piston inlet air cylinders. A condenser is used where the water supply will admit. That the piston inlet valve is as positive when working at low as at high speed is shown by tests made with one of these duplex Cor-

president of the Miners' Union, who was supported in his statements by quite a number of others. Many think that the averments in the affidavits do not meet the complaint, and that no trouble will be had in continuing the injunctions. The matter will be argued June 28th.

At the annual meeting of the stockholders of the Seg. Belcher and Mids Con. Mining

AGAINST THE CHOLLAR.—M. W. Fox is still on the warpath against the milling combine of Nevada, and Judge Hebbard granted his motion to be made a party plaintiff with Theodore Fox as the original complainant in the suit against A. K. P. Harmon, W. E. Sell, A. W. Rose Jr., C. T. Bridge, Joseph Marks, A. Hayward, W. S. Hohart (deceased), the Nevada Mill and Mining and the Chollar Mining companies.

INGERSOLL-SERGEANT DUPLEX CORLISS AIR COMPRESSOR.

to the cylinder, is under thorough control, and may be taken from that point which is most favorable in its dryness, reduced temperature and freedom from dust and other foreign matter. Indicator cards taken on the cylinder of this compressor prove that not only is the cylinder filled with air at atmospheric pressure, but in some cases the line runs above the atmospheric line to the same extent that it runs below in other air compressors. The purpose of the unloading device is to maintain a uniform air pressure in the receiver and a uniform speed of engine, notwithstanding the consumption of the air, and to do this without waste of

liss compressors running at only nine revolutions per minute. The Parke & Lacy Co. are agents for these machines on this coast.

THE mining troubles at Cœur d'Alene have not yet been settled. The Federal Court has been hearing affidavits in the case of the Cœur d'Alene mining troubles read by Frank Ganahl, attorney for the Miners' Union. He read some 50 affidavits, all tending to show that no such condition of affairs existed in Cœur d'Alene as set forth in the complaint, and that hence there was no cause for a continuance of the injunction. The principal one was that of O'Brien,

Co., the following officers were elected for the ensuing year: Thomas Anderson, Pres.; H. M. Levy, Vice-Pres.; and W. H. H. Hart, Herman Zsdig and E. B. Holmes, Directors. E. B. Holmes was reelected Sec'y and S. L. Jones, Supt. The Secretary's financial statement showed a credit of \$10,987.63.

THE Monarch mine, Silver City, Nev., which is in litigation, has brought out two shot-gun brigades, claiming possession. Silver City people deplore litigation over this valuable mine, as it suspends all operations.

This action is similar in nature to that in which M. W. Fox as plaintiff prevailed against the Hale & Norcross company, and obtained a judgment for the mining company for over one million of dollars. As in that case, several directors are charged with having combined with the directors of the Chollar company for the purpose of defrauding the stockholders of the latter corporation.

It is alleged that the milling company crushed 100,000 tons of Chollar ore, for which it overcharged to the extent of \$500,000, and besides realized from the tailings \$125,000.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

The Mines of Tuolumne Co.

From our Traveling Correspondent.

TO THE EDITOR.—Throughout Tuolumne county at this time, mining matters may be said to be quiet. No one, however, should think them dead, as the big mines of this county are pounding away with all their old time regularity and profitability. While there is not a large number of new enterprises starting up, those on the way are proceeding in a manner that shows them to be stayers and expensive in their workings. The reputation of the mines in the county would be far better if the owners of some of the largest mines would allow correspondents to give the value of the ores. Mine owners seem to fear that if the true value of their ores were known the assessor would kindly ask the mine owners to bear the bulk of the county taxes.

Speaking in a general way,

THE ORES OF THE MOTHER LODE

belt, may be said to run from one to twenty-five dollars a ton, while the mines in the central and upper portion of the county range from eight to thirty-five dollars per ton in their free-milling value. In many of the mines a much higher grade of ore is encountered, but it is not, as a rule, average ore. In the Pocket mines the ores cannot be valued by the ton, as the gold occurs in spots only; but in Tuolumne county these pockets are so large in value that this class of mining is here as profitable, and the amount realized, equal to that of the largest mines of milling ores. Crossing over and into the county, the first mines encountered are those of

TUTTLETOWN.

Mining near Tuttletown is confined to Jackass Hill. There is quite a little settlement of miners on the summit of the hill; all of them are hard at work on veins that in times past have yielded many a bonanza. At this time, however, none of the miners are taking out any pockets. In one of the mines I saw a small quartz stringer that was studded with gold, and the miner was patiently and perseveringly following it down, in the hope that it would lead to a quartz crossing, and bring him into a bonanza.

RAWHIDE.

There is now being erected one of the largest and finest plants in the county, which, coupled with the past history of the mine, make this point the most interesting at this time, with every evidence that the interest will be kept up and increased in the years to come. All the work of the section is now centered in the Rawhide mine (W. A. Nevills, General Manager). The mine is situated at Rawhide, and is on the mother lode, which is here enclosed in a belt of very fine, serpentine slate, which may account, to some extent, for the unusual value of the mother-lode ore at this point. In the past history of the mine a large amount of very high grade ore was extracted. The richer ore was shipped to Swansea and ran from \$400 to \$2800 a ton. The last ore shipped to San Francisco yielded \$450 a ton and netted \$384. The ore which was not considered high enough in its grade to warrant shipment was milled on the mine and yielded an average of \$26 a ton.

With these high-ore values the owners held the mine and had it bonded for \$600,000. A silver mill was erected to treat the telluride ores. A portion of this mill is still standing, with its wainscoted interior, sun-fired and painted, mortar timbers and long row of pans and settlers. The mill was not adapted to this class of ores and is one of the many expensive experiments that have always attended mining when conducted by theorists. The present manager has had a long and successful practical experience and is proceeding in a way that assures success from the start. The property has three veins; two of these are parallel to each other with the remaining one almost so. The west vein is four feet wide on the surface and has not been developed. The center or main lode is about 20 feet from the west vein. This center vein averages eight feet in width and on it the principal work is now being done. On the north end of the mine a two-compartment shaft is now down 300 feet. The vein is here 15 feet in width, of high grade but uneven value.

Near the south end and 250 feet north of the old shaft, a fine three-compartment shaft has been put down 120 feet, and will be sunk to 500 feet as soon as the hoist is erected. The vein in the shaft averages eight feet in width. From this shaft crosscuts can be driven to the veins east and

west, if they do not come into the shaft in depth. The east vein differs from the other veins in this, that while they are large and free-milling, it is comparatively small, base, and very high in its value. At the old south shaft, where all the former work was done, the east vein joined the center vein. At this point of junction the center vein averaged \$60 a ton, while the center or base-ore vein ran up into the thousands in value.

At water level, all of the ores at this point became base, and the elaborate silver mill was erected. This east vein is from one to three feet in width and gradually bears away from the center vein as it runs north. Mr. Nevills is crowding ahead with a fine double-reel hoist, with a 40 stamp mill just unloading. It is his intention to work the free-milling veins extensively and cheaply by the usual battery and concentrator process and to treat the 2½ to 3 per cent of sulphurets that the vein carries, and which average \$120 a ton, by chlorination process. The rebellious ore will be handled as may be found most profitable. In all probability the richest ore will be shipped to some reduction works, while the lower grade ores will be crushed and concentrated.

Now, that the Rawhide has fallen into the hands of a practical and experienced miner, there will be no repetition of the old time experiments; but with plain, practical working the mine will be made to give up a satisfactory per cent of its values; and with its past history of exceedingly high values, the mine bids fair to come to the front as one of the most extensive and profitable mines on the mother lode.

QUARTZ MOUNTAIN.

The old Heslep sleeps on her laurels. Her companion, the App, is also idle. The only mine in operation at this time is the Dutch mine. Fitzgerald Bros. and Lucas own this claim. The Dutch is a well-known mine, and bids fair to keep up her enviable reputation as a producer of high grade mother lode quartz. At this time, the owners are sinking on the west ledge and have a very encouraging showing of rich rock. During the past year the ore from this shaft averaged close on to \$30 a ton. The ore from other parts of the mine has not been this high, but all of the ore extracted has paid a good profit. The Dutch wants a good shaft near the center of the claim, which, when down 600 feet, will undoubtedly show up a fine property, as there is contained within the side lines, both the veins of the Heslep and App mines.

GRAVEL.

Near Jamestown, Mr. J. Kallames is operating the Tuolumne Gold M. Co.'s property in the section known as Humbug Flat. The mine is in charge of Mr. D. H. Beecher. The property is opened by an incline shaft 400 feet long, and Mr. Kallames promised your correspondent a sight worth seeing on my next visit. The mine is said to be very good, but the owner is noncommittal.

PEORIA GRAVEL MINES.

This large gravel deposit, J. Prearia owner, has been leased for ten years by the Martha Washington Gravel Mining Co., an Oakland corporation, E. Hall superintendent. The property is situated on Peoria Flat, below Bald Mountain.

At this time the company is actively engaged reconstructing the ditch system. The property is opened by a tunnel 513 feet. This will be driven 300 feet additional and drain the entire flat. The deposit of gravel leased by the company is one mile long and one-half mile wide. The average value of the gravel is said to be \$5 a car of 1½ tons capacity. The gravel is what is known as free gravel, and is easily washed. To save the entire gold contents of the gravel, and avoid any conflict on the debris question, the company will operate the mines with the Bennett amalgamating process. The plant will have a capacity of 2000 yards per day of 24 hours. The inventor claims that his method will save every particle of the gold contents of the gravel, no matter how fine, as by his system the gold is forced by pressure through quicksilver 400 times, by which pressure he means that the gold to escape must pass through quicksilver 400 times. The plant includes a dredging outfit to supply the machine. It is the company's intention to operate the mines by electricity, which is made possible by the 300 feet of fall for water pressure on the mines. When in operation, the manager estimates that the plant will represent an investment in machinery alone of \$75,000. This may be said to be a new departure in gravel mining, and its operation will be closely watched by all owners of auriferous gravels, who are now enjoined from hydraulicking.

SONORA.

The old Bonanza is being given a general overhauling by Messrs. Oliver, Kelley and

Johnston. Everything about the mine shows that the operators have that faith in the future of the mine that comes of the great success in the past. The Bonanza has yielded about \$3,000,000 in the past, and promises to do as well, if not better, in the future. This mine should have the credit of producing the largest piece of gold mined in America. The fact that the miner, to facilitate its extraction, cut and broke the mass in two, should not cause the gold to be called two pieces, as it was one when found.

THE LAST CHANCE

Is the extension of the Bonanza, and is operated by the same company. The operators are stopping out old hacks at present.

THE GOLDEN GATE.

E. C. Loftus is superintendent of this mine, which is considered the leading mine in the county. Under Mr. Loftus' able management, the mine has been developed to a depth of 480 feet, with shaft going to 500, on a vein of eight feet. The plant is very complete and extensive. Unfortunately, the mine has had a very trying and protracted spell of "freeze out," which culminated in a series of lawsuits. The initial suit was just concluded at the time of my visit. In this suit Messrs. W. G. Long and J. C. Behlow claimed that by misrepresentation Mr. J. A. Fisher had caused them to transfer to him, without consideration, 32,000 of the 60,000 shares of the company's stock, which gave Mr. Fisher the controlling interest in the mine. The jury in the case were unanimous in their verdict in favor of Messrs. Long and Behlow, thus returning to them the controlling interest in the mine. The superintendent, Mr. E. C. Loftus, has also brought suit against Mr. Fisher in the Superior Court of San Francisco for the recovery of 11,800 shares of stock, which he claims was obtained from him by Mr. Fisher through misrepresentation.

The writer and the MINING AND SCIENTIFIC PRESS cannot champion the cause of individuals, but it is a promising sign when stockholders, who consider that they have been victimized, can go into court and recover not only their stocks, but the earnings of the same. If we can have a little of this new principle all along the line, mining will cease to be considered by San Francisco capitalists as a business only fit for knaves and suckers.

The Blatt & Gilson Co., under Mr. Tritenbach, has secured an extension of the Golden Gate mine and is reported as having a very promising mine.

The San Giuseppe is idle, pending litigation over the surface ground.

SOULSBYVILLE.

There is but little doing in this once lively camp. Not that the mines are not there, but the mines await the coming of a man with the requisite amount of "sand and soap" to drive out into the 2200 feet of unexplored vein of the famous old Soulsby mine, and thus cause her to add additional millions to her past record. That this mine will be reopened and additional ore shoots found, cannot be doubted. The past history of the property is such that if there was not a shaft 800 feet deep to drift from, the mine would be a far more promising property to invest in than the average prospect on which money is freely spent. With the 800-foot shaft the property is a prize.

THE BLACK OAK.

The Black Oak, U. P. Scott, superintendent, has produced thousands of tons of quartz that has given a steady average value of \$15 a ton. With a strong 6-foot vein to draw on, it is safe to predict that the mine has a good future before it. Just now the ore stopes have been exhausted, and the mill will be shut down until the shaft is put down an additional 100 feet and the levels run.

CHERCKEE.

Mr. Symons has out 150 tons of quartz on the Charlotta, awaiting transportation to the mill. It is safe to say that the ore will average \$35 a ton.

THE PORTO FINO.

The owners are pushing things on the mine and are encouraged to do so by the fine showing. At 80 feet I found the vein in the face of the drift to be eight inches wide of heavily mineralized quartz. The last crushing gave the owners \$25 a ton in free gold, while the sulphurets netted \$5 for each ton of rock, making an average value of \$30 a ton. The vein is free from the walls and gives promise of widening in depth.

In this section, as at Soulsbyville, and across at West Point, Calaveras Co., and Ophir, Placer Co., the veins are in granite. While many operators prefer a slate formation, the old Soulsby mine has shown that as good mines are to be found in the granite of California as the granites of Montana and

other mining sections where granite is given the preference.

THE KELTZ.

This mine is "over on the river," and owing to the circuitous and lengthy route to it, I did not visit the mine on this trip. The property is owned by a Scotch syndicate. The vein is wide and the quartz of good milling value. Owing to the favorable situation of the mine, it can be opened at a great depth by drifts run from the surface on the vein. All that the plant requires is a complete system of power drills and a more modern mill, when, under the present able management, it will soon come to the front.

OLD TUOLUMNE MINE.

This mine, R. C. Davis superintendent, is also "over on the river" above Columbia. Mr. Davis is pegging away at his long tunnel and expects to strike the ore shoot soon. Once this is encountered in the tunnel, the mill will be moved to the mouth of the tunnel and the expense of pumping and hoisting done away with for some time.

SUMMERSVILLE.

At the Eureka Cons., better known as the Dead Horse, things are running along smoothly. The owners, Messrs. Hayward and Hobart, have an excellent plant on the mine; and while there are no values given, the mine is thought to be as good to-day as at any time in its profitable past. Adjoining the Dead Horse is

THE LADY WASHINGTON.

This mine is very extensively developed, and by many considered the equal of the Dead Horse. The mine is being pumped out for inspection, and no doubt a sale will follow.

THE NEW ALBANY.

The mine is known locally as "The Dr. Walker mine." The superintendent is C. S. Fitch. The vein is opened to a depth of 800 feet by an incline shaft, and shows an average width of six feet with a slate hanging and granite foot wall. The mine has a ten-stamp mill, and the best evidence of the ore's value is the fact that the stamps are kept dropping from the proceeds of the mine.

THE BUCHANAN.

The Buchanan is sending out some very glowing reports of exceedingly rich rock in large quantity. The mine has been in the past a good one, and Mr. Davis is inclined to believe that she will continue in well-doing.

In Tuolumne county there are to-day several large mines that offer every inducement to capitalists seeking a large body of free-milling, gold-bearing quartz, with sufficient development in each case to prove the value of the mines. In each case the mines can be purchased on favorable terms and at prices which do not exceed, but are below the value. Once these mines are known, they will be sought after, and once equipped must add very materially to the prosperity of "Old Tuolumne."

E. H. SCHAEFFLE.

The Great Show—Its Uses and Purposes.

SAN FRANCISCO June 4, 1892.

TO THE EDITOR:—That the Columbian Exposition to come off next year in Chicago will surpass anything of the kind ever before gotten up, admits of no doubt. Not only so, but there seems little likelihood that the world will witness another such grand affair for many years to come. That it will not be duplicated in the early future may be assumed. None but a nation possessed of great wealth, advanced in the useful arts and rich in natural resources would be able to get up such an exhibition, nor would any other find it profitable to do so.

Many there are who affect to doubt the utility of these monster exhibitions, especially when attended by such heavy expenditures as the one we have now on our hands; nor is it easy to guess how much the concern is going to cost before we get through with it. Certainly it will require a great deal in the way of indirect gains to compensate for so much money laid out, time lost and energy wasted.

There is no denying that many of the articles displayed at these fairs are deceptive and misleading, being as a rule much better than those manufactured and placed on the market. Both the consumer and the connoisseur buying by these samples are apt to be disappointed. The machine built for exhibition is not the machine that gets into the mill, the factory or the workshop, nor is the fabric woven from selected material and with extra care, the fabric found on the shelves of the merchant and ultimately on the backs of his customers. While not in sympathy with this line of

argumentation we are free to admit that the objections suggested are not without weight. Ignoring however, the question of utility, there appear certain other matters connected with this subject about which all sensible persons should be able to agree. This Chicago Exposition, as we understand it, is not to be a circus nor yet wholly an advertising agency. Such being the case, there will be need to squelch certain spectacular exhibits which it has been proposed shall be made parts of the great show; thus, there has been advocated the building of a tower higher than any even yet erected, and this just to show what we can do in that direction, the project being otherwise purposeless. Another would have all the silver stored in our subtreasuries melted into slabs and from these *planchas de plata* have built a temple, vast and gorgeous; and this as a means of illustrating to visitors from abroad how great is our horde of metallic wealth, the addition of various other attractions, equally tawdry, far fetched and senseless, having been talked of and even strongly recommended; all of which suggests a danger that there may be engrafted on the show much that is meretricious and foreign to its purpose, which consists mainly in promoting the esthetic, scientific and useful, avoiding all that may prove offensive to the cultured taste. For the use of the mountebank, the clown, the commercial traveler and other of the more humble but not unpretentious industries, side shows might be provided. H.

The Cyanide Gold Process.

A Defender of It.

SONORA, Tuolumne Co., June 4, 1892.

TO THE EDITOR:—The same old, old story—prejudice and ignorance against progress; old things, because old, better than new things, however good. So sings "A Practical Miner" in your issue of May 21st, while writing of the MacArthur-Forrest or potassium cyanide process.

It is evident he knows little or nothing of the results obtained in America, Africa, Australia and elsewhere with this process. He seems to be utterly ignorant of the principles and operation of the process, and the literature of the subject, by which I mean the official and therefore authentic publication of results.

How true are the following lines:

A little knowledge is a dangerous thing,
Drink deep or touch not the Pierian spring.

How about the success of the process at the Mercur mine in Utah, Mr. "Practical Miner," where the yield by your pet amalgamation mode of \$4 per ton was carried to \$17 per ton and over by the cyanide process.

How about the result of the process in the Johannesburg mines in Africa, which produced over 80,000 ounces of gold last January, of which 18,000 ounces came from the cyanide process. These are but two from numerous instances of like successful results, of which "Practical Miner" no doubt has never heard. I give here the results of my own experience with the process. During the past 18 months I have tested the process on the most refractory ores of this county, the yield going from 86% to 95% per cent of the fire assay value. These are my facts against his assertions.

"Practical Miner" says, why has not the State Mining Bureau investigated the matter. He had better read the reports of the Bureau before talking. In the annual report of the State Mineralogist (1890) there is an article on the process by Dr. Wm. D. Johnston, chemist of the Bureau, in which he speaks of its future possibilities—possibilities then, realities now.

In industrial matters of all kinds—in every line, there is no more dangerous man, no greater drag to progress than the unlettered practical.

Yes, the cyanide process is a fraud and a failure; so says "Practical Miner." Others equally, if not more practical and of the largest experience and highest scientific attainment, which "Practical Miner" may lack, assert that it is a success after long and close scrutiny, having subjected it to the severest tests. Let the mining public judge between the two.

New things are always received suspiciously by purely practical men. I can recollect when the chlorination process, for several years after its discovery by Plattner, was denounced by just such practical men as your correspondent as a consummate fraud, and so was the Comstock or pan process that has produced over \$600,000,000.

There are innumerable instances of the unreasonable denunciation by practical men of new things; for instance, the locomotive. Some practical men asserted it would not go 10 miles per hour; some said it would not go at all, and some swore they would not ride behind the infernal machine. Such

is the force of prejudice, and ever will be, *e. g.* "A Practical Miner."

He contends that there has been no successful process introduced in late years, and that the country is strewn with the wrecks of abandoned processes. This is not true. If true, it is no argument against the cyanide process, which, so far from being a wreck, is a full-rigged craft with all sail set, making rapid headway.

His contention would check all inventive effort. We would still be pounding away with the old square stamps and driving mules around in a patio, taking six weeks to do what we now accomplish in six hours.

Well, Mr. Editor, this letter is not long, but is long enough to show that "A Practical Miner" knows nothing of the facts of the case he writes about, and therefore that his conclusions will carry no weight among sensible, reasonable men.

LOUIS BLANDING.

The Chick Process.

SAN BERNARDINO, CAL., June 4, 1892.

TO THE EDITOR:—I see in your issue of May 21st a request for information in regard to the "Chick" process in use some years ago in Redding. The same bad chick operated a few years ago in Colton and victimized all with whom he came in contact, winding up by easing a Riverside bank out of several hundred dollars by depositing a so-called gold bar and drawing upon it, saying it was worth about \$800; true value, about \$25 or \$30. Said C. was superintendent, previous to his advent in Colton, of the National City Reduction Works, and was given what is elegantly called the "grand bounce." After his sudden departure from Colton, he was next heard of in Kansas City, where he started a stock company for working his *secret process*, and was going to smelt all kinds of rebellious ores for \$3 per ton, and even interested ex-Governor Glick and a number of other prominent men in the company. But some of the bitten ones here heard of it and sent a full account of his escapades here and elsewhere to Glick, and so pricked the bladder.

The next place for his wonderful "secret process" was Pittsburg, Kansas, where he is enlightening the heathen and spreading himself, as you will readily perceive by perusing about every column of the copy of the Pittsburg *Star* which I send you. I also send you the end of a bar of so-called gold, which he passed out as "returns" of working a lot of ore by his "process," but which I analyzed and found to be "babbit" metal.

So it no doubt will be found that the only thing about the "Chick" process is, that it is a clumsily contrived plan to get money out of the pockets of gullible people and not out of any ore which may unfortunately go through his "secret process." The gist of the whole thing is that the "chick" came from a bad egg. Yours truly, "S."

Processes and Men.

ROCKY BAR, Cal., May 31.

TO THE EDITOR:—I notice in your issue of May 21st you ask for information regarding the "Chick" process, introduced at Redding. I cannot give you details, but inasmuch as the scheme failed I presume that like his operations in Henley in Siskiyou county, and Deadwood, in Trinity county, and subsequently in San Diego county and San Bernardino county, it consisted chiefly in extracting money from the pockets of gullible investors. In that he has been a success, but as for any beneficial results in working ores he has developed nothing.

How strange it is that so many men are induced to put up money on patent or secret processes, alleged to produce wonderful profits from poor ores, promulgated by men who either have never made a success, or are totally unknown to the mining world. Stranger still that the advice and caution of practical men of years of experience and untold trials of processes are unheeded.

Barnum was not far wrong when he stated that "the world liked humbuggery." There are a few, however, that "prefer to have the boil on the other fellow," and if men will rush into untried methods in the hope of obtaining riches from an assumed loss of metal they deserve no sympathy. The sympathy should be bestowed upon the mining interest that has suffered more from charlatanism than has any other industry in California.

ALA MILMAN.

PLATINUM LIGHT.—M. Paquelin has described in the *Comptes Rendues* an incandescent platinum light devised by him. The apparatus consists of a strip of platinum coiled on itself and placed in a platinum bowl with a hollow stem. A gaseous mixture of air and some hydrocarbon vapor is then introduced under pressure in suitable proportions. The mixture is set alight, the flame disappears, and the platinum strip incandesces, the incandescence being the more intense the greater the pressure. With moderate pressures, the light is comparable with that emitted by an electric lamp. The whole apparatus can be plunged into water without the light being extinguished.

Rich Oil Fields.

Remarkable Discoveries in the Foothills of Kern.

Out in the foothills of the Coast Range of mountains, about 35 miles to the south and west of Bakersfield, says the *Californian*, lie some of the most interesting resources of Kern county, which are now being rapidly developed, and which have recently drawn a great deal of attention to Kern county.

Here are the Sunset and Buena Vista oil fields. For a generation or more they have attracted the attention of capitalists, and company after company has been formed only to abandon the field after unsuccessful attempts to reach the precious oils to which surface indication pointed, and often with the fruitless expenditure of many thousands of dollars. In spite of these failures, two enterprising citizens of Bakersfield—Solomon Jewett, president of the Kern Valley Bank, and H. A. Blodget, cashier of that institution—had an abiding faith that oil lay in the rocks below and could be found in paying quantities. About two years ago they began acquiring oil territory by purchase or lease, and now control two belts of territory. Their Sunset fields lie along the lowest foothills, eight miles to the south of Buena Vista lake, and comprise a stretch of ground about six miles long by one mile wide. The Buena Vista fields are of about the same extent and lie several miles to the northwest.

SPRINGS OF MALTHA.

The surface indications of oil in these fields consist of springs of maltha or liquid asphaltum, which, through the course of centuries and perhaps ages, have slowly flown upward and outward, forming cones of asphaltum which have as steadily been buried by blowing sands and the gravel washed down from the hill. From the top of each cone the black, oily maltha slowly oozes and gradually trickles in various directions in sticky, glistening rills.

BORING THE WELLS.

When Messrs. Jewett & Blodget were ready for practical operations about two years ago, they employed as superintendent of the works W. E. Youle, who has had many years of experience in the oil fields of the Pacific Coast and who is regarded as among the best practical operators in the State. From the first, efforts have been made to find the lighter oil, which it was believed awaited discovery, but these efforts were fruitless until the rich strike of lubricating oil made a few weeks ago. As the boring of wells went on, nothing was found but maltha, which, however, was a very valuable feature of the asphaltum deposits. It was found that the asphaltum existing here in almost inexhaustible quantities was in quality equal for every use to the very best produced in any part of the world, and at an early stage of the operations preparations were made to prepare asphaltum for the market. L. Blankenhorn, of Los Angeles, who had had several years of successful experience in handling the products of other California oil fields, was associated with the enterprise, and the firm of L. Blankenhorn & Co. was established for the refining of oils and the manufacture of refined asphaltum, for varnishes, pipe-coating, etc., from the maltha or semiliquid asphaltum above described. Operations have been mainly confined to the Sunset fields so far, and here a number of wells have been sunk, from nearly all of which maltha is steadily pumped. This product, which contains a small percentage of oil, is used for fluxing the hard asphaltum, which is dug out of the surface deposits in a high degree of purity. The work of refining is done partly at the fields but largely at the company's refinery at Sumner. From Bakersfield a large and rapidly increasing amount of refined asphaltum is being shipped, and this point bids fair to become, in the near future, the largest producer of this article in the State and to become noted throughout the country as the chief place from which refined asphaltum comes.

As important and extensive as the production of asphaltum is sure to become in Kern county, it bids fair to be eclipsed by the yield of oil, the recent discovery of which has excited so much attention.

THE LUBRICATING OIL.

About three months ago Superintendent Youle, after a careful study of rock strata and surface indications, started a well about

a mile from the main group of maltha wells, and after reaching a stratum of sandstone at a depth of about 200 feet, a flow of dark greenish oil, entirely different from anything found before, was struck.

The oil was subjected to tests and submitted to experts, with the result that it was pronounced to be a natural lubricating oil fully equal to the famed natural lubricating oil found in West Virginia. Lubricating oil is by far the most valuable oil taken from the earth, and the recent strike has established the richness of the Sunset oil fields in the quality of their product. How extensive the yield will be the future must determine, but the indications now are that Kern county will have the most famous oil fields on the coast, although other fields have yielded millions.

THE ASPHALT FIELDS.

The Buena Vista asphalt fields have so far been but little worked by the Standard Asphalt Company, but extensive operations there, will follow the completion of the Southern Pacific Company's branch line from Bakersfield, which is now being built to the foothills as far as these beds, and which will ultimately be extended to connection with the West Coast line.

The refined asphaltum of the Standard Asphalt Company has been already extensively shipped to Portland, Denver, Ogden, Kansas City, Sedalia, Los Angeles and other points west of the Missouri river, where it is acquiring prestige as a paving material, as well as for coating reservoirs, roofing, etc. The uses to which asphaltum may be put are but just being generally discovered. It makes an ideal coating for reservoirs, flumes and irrigating ditches, surpassing cements in its adaptability for these purposes. As a pipe coating, it has been in use in California for years, and is now shipped East in considerable quantities for this purpose, superseding coal tars, for whose defects and lacking qualities, engineers have sought a practical and cheap substitute now found in California's products. Among the other uses for asphalt in the arts and industries are in roofing and roofing paper; fuel briquettes, varnish and paints, japanning of iron, coating of piles, dock, bridge and tunnel timbers, cisterns and tanks; substitute for rubber, electric insulation, printing, lithographers' ink, etc.

The development of the resources of Kern county described have but fairly begun, and the future promises a rich and unlimited production.

Gold from Sea Water.

The researches of Malaguti, Durocher, Sarzeand and Sonstadt on the practicability of extracting the precious metals from sea water have recently been supplemented by a careful investigation made by a Scandinavian, Herr Munster. According to his method, sea water was taken from Kristiania Fjord, and 100 liters were evaporated to dryness, giving 1830 grammes of residue. This was ground and divided into portions of 300 grammes, each of which was mixed with 100 grammes of litharge, 100 grammes of pure potassium-sodium carbonate and 4 grammes of carbon from starch, and the silver and gold determined. The result was 19 milligrammes of silver and 6 milligrammes of gold per ton of average sea water. Considering the extremely small amounts of precious metals present, Herr Munster considers that no method of precipitation in tanks can possibly be successful. He is of opinion that the precipitation must be effected by the sea itself, where the water is continuously renewed by a natural current, and he points out that the copper sheathing of vessels has long been known to precipitate silver under these circumstances. He proposes that a channel about 60 yards wide, between two small islands, well sheltered from sea or wind, where there is a current of about 13 feet per minute, should be selected for an experiment, such rocky islets being common off the Norwegian coast. Across this channel 60 plates of galvanized iron, each 7 feet by 10 feet, should be arranged at an angle of 30° to the stream, and an electric current be passed through the series to precipitate the precious metals. The power required theoretically for this purpose he calculates at one-half horse power. The large anodes needed, could, Herr Munster says, be cheaply prepared from wood, impregnated with graphite and tar, and carbonized, high conductive power not being required for so weak a current. If all the precious metals passing these plates were precipitated, he estimates that there would be a net yield of £300,000 per annum, and if only the one-hundredth or even the one-thousandth part of this amount were obtained, a substantial profit would accrue in view of the insignificance of the working cost.—Iron.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—*Ledger*, June 4: A considerable cave occurred last Friday in the north shaft of this mine, involving about ten sets of timbers, or a distance of 50 feet. This shaft is mainly for ventilation, and the cave shut the air supply from all the levels, making it impossible for the men to work until the shaft is reopened. The 900 level is supplied with air by a compressor at the 800-foot level, but as the 800-foot level, which is the depth to which the north shaft extends, depends for air upon the caved shaft, the men were unable to work the compressor. The air was so bad that a candle would die out almost immediately. All work in the various drifts is out of until the ventilation is restored. The cave occurred by the dry rot of the shaft timbers, consequent upon hot air coming through the shaft. The timbers were replaced about four years ago. A force of men are at work breaking through the debris, and it is expected that the air current will be restored in a few days. The mill has come to a standstill, and also all underground work, except in the damaged shaft. Only a small portion of the surface ground around the shaft is affected by the cave.

KENNERLY.—An accident happened at the south shaft on Monday last. They had made a new underground waste dump at the 800 level, and fixed it so the skip would dump itself. In hoisting from the lower level to this dumping place, the engineer, for some reason unexplained, omitted to slack off on reaching the dumping place. Something had to give way. It was a trial of the engine against the shaft, and the weakest point proved to be the reel upon which the cable is wound. This was pulled completely out of its place, wrecking things considerably, and bringing all operations in that shaft to a standstill until the damage can be repaired. They have another shaft, however, so that work can proceed, and the mill will be kept running.

CLINTON CONSOLIDATED.—The force at this mine has been reduced about 15 lately, on account of the introduction of air-compressor drills. Mr. Gutman went to San Francisco Wednesday morning.

QUARTZ MOUNTAIN.—The 20-stamp mill crushes an average of 65 tons per day. The ore carries about one per cent of sulphurets of very high grade, which yields an average of \$500 per ton. Unlike most of the mines of the county, the sulphurets contain one-third of their value in silver, and hence they have to be shipped to the Selby Smelting Works of San Francisco for treatment, there being no works in this county for the saving of silver. A test trial of the Woodbury and Frue concentrators has been made at the mill. When Mr. Farwell took hold of the property he put in Woodbury machines, for the reason mainly that Frue machines had been tried there by others, without success. The test, however, has revealed very little difference in the work of the machines. The Frue seems to do its work just as well as the Woodbury, and vice versa. The saving of the fine, high grade sulphurets, which baffled all predecessors, presents no difficulties worth speaking of to those now in charge, and it is a matter of surprise to them that the mine was not worked at a profit as this. Nearly one-half the gold yield is caught in the batteries and on the plates. The batteries are double-discharge, with all-iron frames, and give much better satisfaction than the old style. The company will probably increase the milling capacity to at least 40 stamps. The dimensions of the ore body would justify this, or even an 80-stamp mill, and the rock being low grade, it is only by running through a large quantity that it can be made to pay a handsome profit to the owners.

BAY STATE.—A dispatch was received by Dr. Boyson from the Superintendent, W. T. Jones, Thursday morning, stating that the ledge had been struck 40 feet from the shaft; that the ore body is large, and apparently of good quality. The stockholders are greatly elated over this news. Dr. Boyson is a large shareholder, and wants to get more stock, but there is no stock offering. Propositions have been made to purchase all the unsold stock in the hands of the company, at the paid-up value of the assessment stock, but it was deemed best to decline the offer.

MISCELLANEOUS.—It is reported that the New London is to be refitted with new machinery and started up again. Assays of the ore made below give a value of \$7.50, which ought to yield a handsome profit. It is this rumor that has given birth to the revival of the mine.

SUTTER CREEK.—*Cor. Amador Ledger*, June 4: Lowering the water in the Hector mine has progressed at a rapid rate the last week. There have been no tunnels nor drifts to draw from, and as much as 20 feet has been made in one shift. They are nearing the 400-foot level, and the shaft is still in very good condition. They are about to open a drift between the 300 and 400 levels, where they expect to find some good pay ore, which will materially help in the way of defraying expenses. The mill will be beatified with this end in view as soon as practicable. Crosscutting in the South Eureka has started in earnest. They are drifting east and west, and making good headway. It is thought the ledge will be encountered in a very short distance. At the Belmont, work is progressing favorably, and the prospects are reported as satisfactory. Work is still being continued on a slim scale at the Lincoln.

Butte.

QUARTZ AT BIG BEND.—*Chico Chronicle-Record*, June 4: Robert L. Bohannon is a lucky man.

A short time ago he had the good fortune to find a ledge of rich, free-milling, decomposed quartz on his place at Big Bend. He had some expert miners look at the portion of the lode which he had laid bare, and they pronounced it first-class. The ledge is situated near the mouth of a small gully which comes down from the hills and lies between two points of rock. The lode is about 20 inches wide on top, but it is not known how deep it is, nor is the width on the bottom known. The find has been laid bare to a depth of three feet, but there a point of rock was struck and work suspended for the present. Not being a miner, we dare not venture an opinion as to the actual worth of the deposit in this ledge, but we have it from some old miners and prospectors that they consider the lode found by Bohannon the equal of the Rainbow mine. The ledge is rich in free gold and sulphurets, and it is believed that these deposits are continuous during the entire length of the ledge.

Kern.

SILVEA ORE.—*Kern Co. Californian*, June 6: Andrew Sausser of Agua Caliente was in town Saturday and left some silver ore from his new find at the office of the *Californian*, to be sent with the Kern county mineral exhibit to the World's Fair. The ore is very rich indeed. It very much resembles some of the highest grades of silver ore from Calico district, and shows horn silver and "black metal" in abundance. He has sunk a shaft 20 feet deep upon his claim, finding a vein averaging 12 inches in width of this rich silver ore, and so far as he has prospected upon the surface, he has found an ore chute 46 feet long. Several locations have been made upon this vein, which can be traced for a long distance, and in one other place at least, ore of the same quality and richness has been discovered. This strike is creating a great deal of excitement, as well it may, and already 16 claims have been located. The mines are easy of access, with ample water and timber for working purposes, and therefore too near home to cause much of a stampede. They are located in what is called the Agua Caliente district, easiest of access by way of Waker's basin, and can be reached over good roads in less than a day's travel from the railroad station of Caliente. Mr. Sausser discovered the outcroppings last fall, but only recently commenced active work upon the vein. He has already had several tons hauled to the railroad at Caliente, and expects soon to ship a carload to San Francisco. It must be confessed that the disc very of silver ore in that locality is a new thing. That whole region has been prospected over and over again for gold, and many tons of fair and even rich milling rock have been extracted in times past. The Stuter & McKay group of mines in that locality is still being profitably worked for gold, and, near by, Mr. Sausser himself has about 120 tons mined out to arrastre, which will yield from \$20 to \$25 per ton in gold.

Los Angeles.

SNELTER.—*Oil Reporter*, June 4: Two weeks ago Maj. L. C. Moreland sold half of his gold mine on the desert to Chicago parties for \$45,000, and it was stipulated in the articles of sale that the company should erect at once a mill on the property to cost not less than \$25,000. Major Moreland is at present on the grounds, and as soon as the erection of the mill commences will return to this city and give his attention to the proposition of starting a smelter here. Propositions from San Diego, San Bernardino and Needles have been made to Major Moreland to interest himself at one of those places, but having given the matter a personal investigation, he has wisely concluded that Los Angeles is the most desirable point for such a plant, owing to the unrivaled railroad facilities which this city enjoys.

Mono.

CONCORDIA.—*Bodie Miner*, June 3: Work has been resumed on the Concordia mine, which has been idle for several years. During the booming days of Bodie, it was a mine of considerable importance, and some very rich silver ore was taken out and milled at the Noonday mill. We understand that work will soon be resumed on the consolidated Pacific, and the ore, of which there is a large quantity in sight, will be treated by a new process, and one that experienced millmen think will be successful.

THE BODIE CON.—*Miner*, June 3: During the past week east crosscut No. 1, 700-foot level, was extended 9 feet. East crosscut No. 1, 550-foot level, was extended 7 feet. North drift from east crosscut from above level was extended 11 feet. We have a seam of ore in this drift that is very good. Upraise above the 400-foot level was extended 8 feet. There are about 8 inches of \$30 ore in this drift.

MONO.—During the past week north drift from west crosscut, 600-foot level, was extended six feet. Upraise from east crosscut, same level, was extended 12 feet. There is a very rich seam of ore in this upraise. West crosscut No. 2, same level, was extended 11 feet. We are taking out pans and settlers at the Bulwer mill and moving them to the Bodie.

Nevada.

NOTES.—*Grass Valley Union*, June 7: The Merrimac mine is looking well, and is giving every encouragement of yielding profitably before long. A force of four men is at work on the Osborn Hill mine, in retimbering the main shaft near the surface, and in removing the debris that has accumulated in the shaft during the many years that the mine has been idle. It is thought that the shaft will be found in good condition below the water level, which will be at a depth of about 65 feet from the surface. James Paul is foreman of the work that is being done.

Orange.

THE TRABUCCO COMPANY.—*Los Angeles Oil Reporter*, June 4: Several mining companies have been organized and incorporated in Los An-

geles during this month, the latest organization being the Trabucco Gold Mining Company. The properties of the company are situated in and near the head of the Trabucco canyon, in Orange county, about one mile from the dividing line between San Diego and San Bernardino counties—62 miles from this city. There are four quartz mining claims, as well as a mill site of five acres, with an abundance of wood and water in close proximity. Considerable tunneling has been done on the claims, and in every instance the result has been most satisfactory to the company, the ores assaying from \$9.80 to \$48.60 in gold and from three to eight ounces in silver, the veins being from eighteen inches to three or four feet in width. There is at present 500 tons of ore on the dump, and it is the intention of the company to commence at once the erection of works on the property, and the development on the claims will be proceeded with immediately under the superintendency of Mr. John Corbett, a practical and experienced miner. The Trabucco gives hopeful promise of becoming a big paying property and the directors feel assured that it will prove a veritable bonanza.

Sierra.

HANDSOME GOLD YIELD.—*Mt. Messenger*, June 4: The aggregate cleanups of the Bald Mt. Ex. Drift mine, for the past month, 24 working days and like number of gravel pickers, were 864 ounces and 17 pennyweights—\$16,68.84 paid for the gold by Scamman's Bank, Downieville. One nugget weighed 22 ounces, and others from one to several ounces. About 50 men are employed, and indications are very favorable for a good paying property for years. Dividend No. 19, of ten cents a share—\$6000—was declared this week, for the lucky stockholders.

Siskiyou.

QUARTZ AND GRAVEL.—*Yreka Journal*, June 1: Schroeder & Werner, of the famous Deadwood quartz ledges near the summit of Deadwood mountain, about nine miles south of Yreka, have been taking out considerable fine-looking quartz from the stopes of the eighth level, and next week intend putting on a night shift, so as to keep the mill in operation day and night. Arthur Scheld and Clarence Davis still continue to get out rich-looking ore from their ledge on Long Gulch, and will soon have enough on the dump for another crushing in their mill. The Boyle quartz mine at the head of Humburg creek is yielding very rich quartz in great quantity, and the work of crushing is carried on energetically by working both a stamp mill and one of the Huntington grinding mills. Leonard & Co., just above the mouth of Scott river, on the Klamath, are putting in two mammoth windmills, and expect to take out considerable gold this summer. This claim paid handsomely last season, and also during the previous season of two years ago. The Chinese company working the Benz Bar claim at Honolulu, on Klamath river, are reported as doing exceedingly well in taking out gold dust. This company of about a dozen stockholders usually make dividends of \$800 to \$1000 to each man in two or three weeks' time when their claim is in good working order. At present they are short-handed on account of Chinamen not being so numerous as in former years.

Tuolumne.

BUCHANAN.—*Union Democrat*, June 4: A rich body of ore was struck last Thursday morning in the Buchanan mine. A drift was being run to tap the old works, when the rich ore was encountered. The extent of the ore body is unknown, but gives every promise of being large. The mine, we understand, is looking very encouraging in the old works. The ore in the drift in which Daley was killed is reported to be very rich in free gold.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—*Enterprise*, June 5: 1600 level—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted, and some very good ore has been taken out along the ore streak on the east side of the old timbers. 1650 level—Have continued prospecting west from the upraise 35 feet above the sill floor, which was carried up 59 feet above the southwest drift. Ore of fair quality has been extracted from the drift running east from winze No. 3, 73 feet down, in working upward from that point. From the north end of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality. The drift started south from the bottom of the winze sunk 28 feet in this locality through the old timbers has been advanced 30 feet in a porphyry formation carrying narrow streaks of quartz of very low assay value. There has been extracted from all parts of the mine during the week 1029 1660-2000 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was \$30.47 per ton. The average assay value of all the ore worked at that mill during the week (980 tons) was \$26.54 per ton, per battery samples. Bullion shipped to the Carson Mint, assay value, \$33,877.40.

OPHIR.—1465 level—The drift running south 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground has been extended during the week 17 feet; total length 70 feet; and we have extracted therefrom and raised to the surface 36 tons of ore, the average assay value of which was \$21.92 per ton. The face of the drift is in porphyry and quartz carrying an assay value of \$3 per ton.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winze sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 16 feet; total length 46 feet;

continuing in a porphyry formation, showing fine lines of quartz and some clay.

GOULD & CURRY.—On the Suto tunnel level the joint north drift with the Savage Co. has been temporarily discontinued on account of the air not being good enough to work with. In order to obtain better air we have started a joint upraise in the Suto tunnel, near the mouth of this drift, with the Savage Co., to make connection with their 1500 level. The upraise has been carried up a distance of 65 feet; face in quartz and porphyry.

BEST & BELCHEA.—900 level—East crosscut No. 1 has been advanced 18 feet through hard porphyry; total length 194 feet. West crosscut No. 1 has been extended 22 feet; total length 283 feet; through a formation of hard porphyry and stringers of quartz.

HALE & NORCROSS.—On the 800 level are repairing north drift. On the 900 level we continue to stope ore from above this level and extracted from same during the week 256 cars of ore. The stopes on this level are looking about the same as at last report. 1000 level—Have advanced the south drift from bottom of 900 north winze 20 feet, making the entire length 35 feet. The face of the drift shows some pay ore. 1100 level—Are stopping out ore from north and south stopes, and advanced the south upraise in south stope 25 feet; face showing some ore of fair quality. The stopes on this level are not looking as well as at last report. Hoisted from this level during the week 167 cars of ore. 1300 level—We are stopping out ore north and south from winze. There is no change of importance in the appearance of these stopes. Are also working at the new station on this level. Hoisted from this level during the week 49 cars of ore. 1640 level—The main incline was cleaned out and repaired a distance of 45 feet the past week. The total depth below Suto tunnel level, 60 feet. We have men on repairs in the main shaft and at other points in the mine where necessary. Hoisted during the week 472 cars of ore. Shipped to Brunswick mill 429 170-2000 tons. Average assay of railroad car samples of ore shipped to Brunswick mill for the week, \$20.08; average battery assay for the week, \$14.66. Shipped from Brunswick mill to U. S. Mint, Carson, bullion of the assay value of \$11,548.31—this being the final shipment on May account.

OCCIDENTAL.—Have commenced extracting ore from the stopes on 300, 350, 400 and 450 levels, and will start the mill on Monday, June 6th. West crosscut No. 2, 750 level, is in 60 feet and continues in low-grade ore. The main north drift on this level has been connected with No. 1 winze sunk from the 650 level, and a crosscut has been started from the bottom of the winze. The Zadir drift from the Suto tunnel is now in a total distance of 592 feet.

ANDER.—On the 420 level north drift from west crosscut No. 2 advanced 5 feet, connecting with west crosscut No. 3. Work resumed on west crosscut No. 3 and same advanced 20 feet; formation, clay and quartz.

POROSI.—Are repairing Werrin shaft from surface to 250 level. South drift from winze, 1500 level, is out 60 feet; face in quartz and porphyry. The south winze, 20 feet south of winze connection, 1200 level, is down 21 feet. In the bottom there is 3 feet of ore that gives low assays. The joint Bullion winze is down 347 feet below the 1500 level; bottom in low-grade quartz. Extracted and sent to the mill the past week 380 1600-2000 tons of ore from the 930, 1100, 1150 and 1200 levels. Milled during the week 415 tons. On hand at mill 46 800-2000 tons. Average battery assay, \$19.66. Average car sample assays, \$23.69. Sent to Carson 4301 pounds of crude bullion.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, was extended during the week 30 feet, making a total distance west of shaft of 2054 feet; face in porphyry.

SIERRA NEVADA.—The west crosscut No. 1 from north drift, Kenosha tunnel, 1000 feet in, has been advanced 28 feet; total distance, 123 feet; face in hard porphyry. The joint Sierra Nevada and Union west drift, 900 level, was extended during the week 31 feet, making its total distance west of shaft 2054 feet; face in porphyry.

CHOLLAR.—We are making repairs on the 450 and 750 levels. The north drift from the station, 930 level, has been repaired to a distance of 450 feet from the station.

CON. NEW YORK.—The north drift from No. 4 crosscut, 650 level, is out 43 feet, the whole distance in low-grade ore. Are cutting out for a winze station to sink on the ore in the north drift from No. 4 crosscut, 650 level. We are also repairing the 800 level drifts.

SILVER HILL.—The north drift from the Justice shaft, 490 level, is out 735 feet; face in porphyry.

WARD SHAFT.—The joint Alpha and Exchequer south drift from the north line of Exchequer, 1800 level of Ward shaft, has been extended 26 feet during the week; total length 106 feet; face in clay and porphyry. The joint Bullion and Potosi northwest drift from the 1800 level has been advanced 25 feet during the week; total length 460 feet; face in clay and porphyry.

ALPHA.—The joint Alpha and Exchequer south drift from north line of Exchequer, 1800 level of Ward shaft, has been extended during the week 26 feet; total length 106 feet; face in clay and porphyry.

EXCHEQUER.—The joint Alpha and Exchequer south drift from the north line of the Exchequer, 1800 level, has been extended during the week 26 feet; total length 156 feet; clay and porphyry.

NAVAJO.—*Times-Review*, June 3: The stopes above the 350-foot level continue to yield about the same.

BELLE ISLE.—No. 1 west crosscut, 250-foot level, extended 13 feet. North drift, same level, extended seven feet.

NORTH BELLE ISLE.—No. 1 north drift, 400-foot level, extended 14 feet. No. 1 upraise from same extended 16 feet, and a drift started south

at this point. A winze has been started on the rich ore in the north end of No. 3 drift. The stopes generally are looking well.

NEVADA QUEEN.—Second level.—West drift from No. 1 chute advanced 21 feet, face of drift in second-class ore assaying \$26.72 per ton. South drift on the west vein has been run 15 feet; the ore is not so good as 1. st reported. North drift from same point extended 14 feet; the ore has improved; is now first-class. South drift from No. 3 shaft extended 12 feet, 2 feet of low-grade ore. Stopes continue about as last reported. Have produced during the week 152 cars first-class ore, which has been sent to the mill; average assay, \$211 per ton, and 785 cars second-class; average assay from concentrator, \$28.90 per ton.

Hawthorne District.

BONDED.—Hawthorne Bulletin, June 4: The Umattila, Denver and Bright Light mines, in Nevewest canyon, Hawthorne district, were bonded to S. L. Hanak & Co. of Salt Lake last week. The conditions of the bond were that \$5000 was to be paid within 60 days, and if not paid in that time the amount is to be \$7500. A. H. Finney, principal owner, is to work the mines for the purpose of development, in conjunction with Dave Millsaps. These mines are said to be very promising properties, and as Mr. Hanak represents large capital, it is to be hoped that he will work the mines for all they are worth.

St. Louis District.

TO STOP.—Cor. Walker Lake Bulletin, June 4: Jack Maney arrived from St. Louis district on the 20th. He shipped a carload of ore to the Selby Works, California, which will average 500 ounces silver and \$18 per ton gold. Maney & Walsh have plenty of ore in sight, but owing to the low price of silver have determined to stop work and ship no more. They have four men employed. Bob Robinson's claim adjoins Maney & Walsh's. They have struck the ledge at a depth of 20 feet. The ore is of the same character, averaging about \$300 per ton. Knapp & McNaughton, on the same ledge, are taking out ore in paying quantities. Stoner & Rickards are doing first rate on their placer claim in Tule canyon. They are averaging \$3 per day.

ARIZONA.

THE CYANIDE PROCESS.—Arizona Journal-Miner, June 4: The proposition to establish a plant in Prescott to treat ores by the MacArthur-Forrest process is beginning to take tangible shape. Two more mining deals, in which the purchase price runs away up into the upper tens of thousands, is on the tapis. T. A. Conlee continues his development work on the Johnson mine, near Stanton. The mine continues to look well as development progresses. The leaching works and smelter at Copper Basin are running regularly now, and shipments of copper are being made. About 35 men are employed at the mines and reduction plant. W. W. Horton arrived on yesterday's train from London to examine the Lone Star mine. Four other gentlemen who are also interested in a proposed deal for this property are expected in a few days. The mine is well opened up, and shows a large quantity of good ore.

NOT A FAILURE.—The statement made by a correspondent to the effect that the MacArthur-Forrest process had proven a failure in the treatment of Crowned King ore is denied. The rumor probably arose from the fact that when in readiness to put it to a test on a large scale, it was discovered that they had an insufficient supply of cyanide on hand, and they were compelled to await the arrival of an additional supply from Phoenix, which is now en route to the mine. Contrary to its proving a failure, the tests made of the ore and concentrates proved highly satisfactory, and those having the matter in charge have no doubt whatever of the complete success of the treatment of the ore and concentrates from this mine.

IDAHO.

TO START.—Hailey Times, June 2: Mr. Bailey reports that he will start up the Champlain mine and mill to-morrow. This property has lain idle for two years, owing to litigation in which the company became involved, and not to any want of merit in the mine. The mill is new and in good order. The ledge is opened with tunnels and shafts, all ready to commence stoping ore. The Champlain ought to be a success.

WOLF TONE.—The Wolf Tone was a prominent mine on Wood river in 1881; about that time it sold for \$25,000. The company worked the property, took out some money, then, having lost their ore chutes, ceased operations. Last year they failed to do the annual work, the ground being abandoned; it was relocated by John McFarlane and associates. To-day, operations will be commenced looking to the opening up of the property; four miners will be put to work. The present owners apprehend no trouble in finding the ore body.

THE SILVER KING.—Major Hyndman's success in opening the road to Sawtooth calls attention to the Silver King. During the last two years the Major has spent \$25,000 in developing this property. Success has, however, crowned Mr. Hyndman's efforts, and he now has one of the best mines on the Sawtooth range, developed and ready for the extraction of ore. The Silver King is opened by a double compartment shaft, 600 feet in depth. Drifts have been run on the 400 and 500 foot levels. The ore is high grade, giving returns of 300 ounces silver per ton and from \$3 to \$5 in gold. There is out on the dumps 2000 tons of concentrating ore of a good grade which will be handled as soon as a concentrating plant can be put in place.

THE ARGENT MINE.—Mr. Mentandon has made a visit to the Argent mine, one of the French boys' group on the Bullion divide; examined that part of the claim worked by Mr.

McLeod, the lessee, which consists of the ground between the lower and middle levels. It shows very fine ore in both levels, averaging from 4 to 15 inches of good ore.

MONTANA.

ARE WELL THOUGHT OF NOW.—Butte Inter-Mountain, June 1: There are three sections of Butte which are producing rich ore to-day, that a little more than a year ago were abandoned or neglected and not considered worth the trouble of development. Reference is made, first, to the Ground Squirrel district, just a few yards north of the Parrot smelter; second, the Olive Branch district, due west of the Colorado smelter; and, third, the Eveline, in a direct line west of the Lexington. Each of these places is producing rich ore, notably the Eveline. This property continues to turn out ore of a very high grade, there being a streak of about ten inches through the vein that carries some of the richest silver ore ever found in Butte. This rich ore is found both on the east and west ends of the claim. There are two shafts on the property being worked by separate parties.

PHILIPSBURG REPORT.—Reports from Philipsburg are to the effect that the Hope Mining Co. has a heap of trouble on its hands, and the assertion is made that it will result in tying the property up for an indefinite period within the next ten days. It is claimed that the Hope Company has knowingly, for a long time, been extracting ore from property which it does not own. Some of this property has also become valuable for real estate, and a number of suits for hearing damages are said to be pending. It is believed that the Bimetallic Extension Co. has encountered the much coveted vein. During the past week, from the north crosscut, the diamond drill penetrates two leads. One of them shows up remarkably well and has an assay value equal to the vein of the Bimetalic, of which it is believed to be an extension. Ninety-two bars of silver bullion were shipped from Philipsburg during the week.

NEW MEXICO.

TO BLOW IN.—Southwest Sentinel, June 1: Work is going on in the Anson S. mine at Ansonio, and the smelter will be blown in again about the 10th of June. A small proportion of ore from the mines at Copper Flat will be mixed with the Anson S. ore in making the charges for the smelter. The Manhattan G. M. and M. Co. has asked for bids for completing the Montana tunnel, and it is expected that a contract will be let some time next month for completing the work. M. W. Neff came in from Copper Flat last Friday and says that his copper mines there are looking fine. He discontinued smelting the ore at the Anson S. smelter for the reason that it took too much flux to treat the ore. In order to get satisfactory returns, as much iron ore had to be used as there was copper ore smelted, and this reduced the grade to such an extent that the ore could not be profitably handled there. A carload of the ore has been shipped to Pueblo. William Werney has just received returns from nine tons of ore, which was treated at the Gold Hill custom mill. The ore was from the Eagle mine and ran \$421.06. The returns show that there is less than a dollar a ton in silver in the ore. The Gold Hill custom mill is running five stamps, and if water can be obtained more will be started. John Spiller, superintendent for the Pacific Gold Co., has gone to St. Louis to attend a meeting of the stockholders of the company. The mill here has been idle for several weeks on account of the inability of the Silver City Water Co. to furnish water for it.

MOGOLONS.—Cor. Silver City Enterprise, June 2: The camp is unusually quiet, owing principally to the shutting down of the Last Chance mill on the 25th ult. There are a few idle men in camp, but they will all get employment as soon as the Maud S. is opened up and gets ready to break ore for the new mill. The winze on the Maud S. will be completed this week, probably, as the contractors are rushing things, and have but eight or ten feet more to sink. The tramway is moving along rapidly, and will shortly be completed. Its use will save handling the ore for itself. The Maud S. mill is being pushed to completion, and it is confidently expected that it will be ready for business by July 4th. The mill, when completed, will be one of the most conveniently arranged in the Territory; as all the ores from the different workings in the mine will be delivered directly into the ore bins. Two Huntington mills of 15 tons capacity each, propelled by a 100-horse power engine of the Atlas pattern, and six amalgamating pans, will produce bullion in quantities to surprise the new owners of the property. John T. Mitchell, formerly of Silver City, has charge of the mine, and is opening it up in good shape. Smith & Thomas have struck a bonanza on their Deadwood property, the ore showing free gold plentifully. They are running a tunnel in from the gulch, and will strike the ledge at 100 feet deep. They have not reached the vein yet, but it is near by, and they expect to strike it in a few days.

OREGON.

FROM THE MINES.—Eugene Register, June 1: B. F. Dorris returned Monday from a trip to Blue river mines. He reports everything going on nicely up there. There are a dozen or more men at work in the different claims in that region. In the placer mines recently discovered there are half a dozen men at work, and they appear to be doing well and seem satisfied that they can make money there. It is to be hoped that a good mill can be put up there this summer. There is evidently plenty of gold there, but there are no means now of making anything mining it.

BRIMFOOT.—Bedrock Democrat, June 3: The mining outlook in this portion of the county is more favorable than it has been for a

number of years. Messrs. Bartholomew, Rust & Co. are opening a claim on Upper Clark creek which will undoubtedly prove rich. A Barnhart is working about two miles below, and expects to take out a large amount of the precious metal. Aug. Meyer has plenty of water and a full force of men at work. He will probably do better than he has done for a number of years, and the claim has always paid well. Archie Murray & Co. have commenced on their season run. You will hear a good report from this claim as soon as they make their next cleanup.

SPARTA NOTES.—Mr. Samuel Palmer has made a rich discovery of quartz on Little Baldy mountain. Mr. Lee, of Pine Valley, is hauling mining timbers to the mouth of Maiden gulch, on Powder river, for Clark & Kennedy. Their mine is showing up well. We understand that Mr. A. Tarter has sold his half interest in the Crystal Palace mine to a gentleman from Portland. Did not learn his name. No doubt Mr. Jones will also sell his half.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MAY 31, 1892.

476,180.—PROTECTING BUNOWAYS OF BARRELS—M. Anthony, Berkeley, Cal.

475,972.—CARBURETER—E. B. Badlam, San Francisco.

475,974.—TWO-WHEELED VEHICLE—J. A. Bilz, Pleasanton, Cal.

476,039.—SWIMMING EQUIPMENT—P. Curran, Hoquiam, Wash.

476,040.—LEG ATTACHMENT FOR SWIMMERS—P. Curran, Hoquiam, Wash.

476,043.—WATER SUPPLY SYSTEM—J. W. Fisher, Palouse, Wash.

475,762.—SPINDLE NUT—Frazer & Brown, National City, Cal.

475,853.—BOOT OR SHOE—G. E. Hadlund, Portland, Or.

475,859.—GRINDING MILL—L. D. Harding, Colfax, Wash.

475,963.—HOISTING APPARATUS—J. W. Kinsman, San Francisco.

475,964.—FINOEA BAR—M. N. Laufenburg, Stockton, Cal.

474,875.—INDICATING FUNNEL—I. W. Lord, Cucamonga, Cal.

475,967.—OIL GAUGE FOR LAMPS—T. A. McGovern, Bolinas, Cal.

475,968.—WEIGHING DEVICE—D. W. McLaughlin, San Leandro, Cal.

475,965.—CAR AXLE—D. M. Miller, Fairfield, Cal.

476,064.—SAFETY LOCK FOR HAMMERLESS GUNS—R. L. Palmer, Tacoma, Wash.

475,827.—HORSE BOOT—J. Summers, San Francisco.

475,971.—SNAP HOOK—Frank White, Pomona, Cal.

476,109.—HOASE CONTRAILINO DEVICE—D. T. Woodman, Bloksburg, Cal.

The following brief list by telegraph, for June 9, will appear more complete on receipt of mail advices:

California.—San Francisco, Joseph H. Magney, cash balance; Fred W. Vaughan, wheel cultivator; Anthony N. Klein, letter box; Thomas Barnett, broiler and toaster; Alexander J. McAdam, wick adjuster for lamps; Oakland—Alva M. Stetson, amalgamator; Claudius H. Mitchell and R. M. Veitch, bicycle tire; E. Oliver, paper-holder. Los Angeles—Frank W. Kringling, touch-regulating device for pianos; Joseph Gunder, perpetual monthly calendar. Fresno—Horace H. Taylor, surgical instrument. Angels Camp—James Tulloch, concentrator; Quincy, Wm. H. Leck, educational apparatus.

Oregon.—Ashley Bancroft, Portland, traveling bag; Otto J. E. Beeseler, Mount Angel, warehouse gang-plank; Otto Van Ostrom, Portland, dam.

Washington.—Charles S. Terpeuing, Prescott, suspender brace; Geo. A. Miller, Colfax, well-boring and prospecting; John N. Lewis, Conlee City, rail joint.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SNAP HOOK.—Frank White, Pomona, Los Angeles Co. No. 475,971. Dated May 31, 1892. The object of this invention is to provide a strong, simple, neat, economical and generally effective snap hook. The construction, which is economical, is such that sand or dirt may escape from the tubular bolt instead of being retained to impede the action of the spring. A pivotal link or ring saves wear on the leather or rope.

CAR AXLE.—David M. Miller, Fairfield, Solano Co. No. 475,965. Dated May 31, 1892. This improvement in car axles consists in dividing the axle near the center and in a peculiar sleeve or coupling by which the two parts are held together and allowed to rotate independently of each other. The double cone-shaped sleeve, with the inclosing conical clamping collars and the pin and socket connection of the abutting ends of the axle form a powerful supporting truss, which overcomes any objection of lack of strength in the structure. Either of the wheels which are fixed to the opposite ends of the axle, can turn independent of the other, as when passing around curves.

TWO-WHEELED VEHICLE.—John A. Bilz, Pleasanton, No. 475,974. Dated May 31, 1892. The object of this invention is to provide a simple and durable vehicle which, on account of its lightness, may be properly termed a

"speeding cart," and in which, by the peculiar arrangement of parts, and especially of the axle, the horse may be hitched up close and brought back as far under the driver as possible, and the driver's seat may have all the necessary spring for comfort.

HOISTING APPARATUS.—James W. Kinsman, S. F. No. 475,963. Dated May 31, 1892. This hoisting apparatus is one of those devices designed for unloading coal and other material in bulk from ships and depositing it in more or less distant pockets or bunkers. It is intended to provide an apparatus in which a minimum amount of manual labor is necessary, and by which the material may be rapidly conveyed to the pockets or bunkers located at any suitable distance.

SKID FOR LOADING AND HANDLING LOGS. David Evans, E. H. Percy and Bethune Perry, Eureka, Humboldt Co., Cal. No. 475,511. Dated May 17, 1892. The invention relates to the general class of log-handling machinery, and particularly to the class of devices for loading logs on the sawmill-carriage and handling them thereon. The object of the invention is to provide an apparatus or machine for loading or handling logs in sawmills and other places by power, said object being accomplished by a novel arrangement, construction and application of parts, in such a manner as to provide a simple, convenient and easily operated machine for this purpose, which will handle the logs from the mill bed or deck to the saw carriage, load them quickly on to the carriage, will adjust them rapidly thereon to a proper position in relation to the head blocks, and will turn them down on the carriage, when so desired, into a new position and readjustment for sawing.

GAS BURNER.—Geo. I. Ewers, San Francisco. No. 475,012. Dated May 17, 1892. The invention relates to an improvement in gas burners or to an attachment for gas burners, the object of which is to automatically shut off the flow of gas, when the flame from any cause becomes extinguished, while the stopcock remains open. It consists of a supplemental valve, a means for opening said valve and retaining it open to permit the gas to flow when the stopcock is turned on to allow the gas to be lighted, a means by which said valve is released from its holding-catch, but still retained in its open position while the gas is burning, and a means by which it is closed after the gas is extinguished. By the construction shown, the inventor provides a supplemental, automatic-closing valve which will always act independently of the main cock and after the gas is extinguished. If this cock be left open either accidentally or otherwise, no escape of gas through the burner can take place after the burner has cooled.

FINOEA BAA.—M. N. Laufenburg, Stockton. No. 475,964. Dated May 31, 1892. The usual construction for finger-bar for headers and similar machinery is either to secure the guard directly into a wooden beam or to a beam which is made of angle iron or steel. Both these constructions are open to objection—in the first, because any undue strain caused by the point of one of the guards striking the ground is apt to split the bar, and in the second because such strain will break the guard and bolt-holes and make it difficult to replace it. In this invention, Mr. Laufenburg uses a peculiar composite bar.

OIL GAUGE FOR LAMPS.—Thos. A. McGovern, Bolinas, Marin Co. No. 475,067. Dated May 31, 1892. This oil gauge is especially adapted for lanterns or lamps having opaque sides. It consists of a vertical transparent tube, open at each end, a casing within which the tube is secured, and by which it is attached to the inner side of the lamp reservoir opposite an opening through which it may be inspected, and a slide for closing said opening at will. Lanterns which are used by railroad men and others often cause annoyance by going out from lack of oil when away from a source of supply. This invention will allow the ready inspection of the quantity of oil contained in a lantern, so that the person will be enabled to take a lantern which is full and also to know when it is necessary to replenish without the necessity of taking off the top.

Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

ARIZONA MINES.		Hale & Norcross.		Dr. Cr.

NOTE.—Con. Cal. & Va. has bullion on hand amounting to \$15,705, and further shipments to arrive. Navajo has 163,715 in unsold bullion and \$12,800 due on pumping account. Hale & Norcross has \$7547.46 in unsold bullion.

MECHANICAL PROGRESS.

The Cast-Iron Pipe Trade.

Mr. Peter D. Wanner, the chairman of the Mellert Foundry and Machine Co. of Reading, Pa., read the following interesting paper recently before the Reading Board of Trade:

"The use of cast-iron pipes grew out of the wants of water works about the beginning of the present century. There were 16 of these works in the country prior to the year 1800, and 87 in the year 1850. Up to this point of time the pipe trade had developed slowly and was not regarded as of much importance. After 1850, however, the large and rapid increase of water and gas works made the demand for pipe proportionately large, giving new life and vigor to the industry. About this time the Mellerts began the manufacture of cast-iron pipe in this city. The panic of 1857, as well as the Civil War, retarded the trade very considerably. During the war only a few works of either gas or water were constructed, and it was not until after 1865 that the business in this line again commenced to improve, and increased to such an extent that even the panic of the seventies did not appear to affect it during the year 1878. Owing probably to an overbuilding of water and gas works, and the high price of pig iron then ruling, the trade remained quiet until the summer of 1881, when it became very active, and remained large and profitable until the end of 1887. These were six years of unprecedented prosperity for the pipe manufacturers of this country, but with them disappeared the profits of the trade.

With net earnings for 1887 away up among the thousands, we had to be contented at the winding up of the following year with a few hundred dollars. Since then the best possible management was required to hold what had been previously accumulated and meet current charges, and should we take into account the wear and tear of machinery and fixtures, necessary repairs and improvements that should have been made, but were postponed, excepting only cases of absolute necessity, it would be entirely safe to say that no money has been made.

If any pipe foundry can show a better record I should like to hear from it, and yet during all this time the demand was large and the number of water and gas works increased to an aggregate of 2200 for water and 1200 for gas, having a mileage of probably not less than 50,000, or twice around the world.

The trade was also increased of late years by a demand from railroads, etc., for sewer, drainage and culvert purposes, but owing to the great number of new pipe foundries constructed throughout the South and West, and the increased capacity of the older ones, the demand fell short of the supply. In other words, we have had overproduction, plain and simple.

All the new foundries built since the boom of the eighties could well have been spared and the money saved to the investors; but men learn by experience only.

View the situation as we may, it clearly means that this once prosperous and profitable trade will become uncertain and of doubtful tenure, and that location, equipment and management will be the essential elements tributary to the success of the pipe foundries in the future, North and South. It is, in my opinion, however, absurd for this or other iron industries in the South, no matter what their financial strength may be, to presume that they can either obtain or hold any great portion of this trade. It is true they have closed up a number of furnaces and pipe foundries throughout the North, of which many will never run again, yet there are others which will meet every cut in price and remain in the trade. Having cut to cost and below, their next move must necessarily be on wages as a last resort, and the inevitable. Thus this abnormal stimulation of the pipe and iron industries, beyond the wants of the South and of the country at large, is bringing discomfort and ruin to many once happy homes throughout the North.

CONVERSION OF MECHANICAL INTO ELECTRICAL ENERGY.—It has been found that to produce a given electromotive force and current a certain expenditure of power is indispensable, since electricity itself is but another form of motion, which requires power to produce it. It is also found that whether we seek to produce one volt and a current of 1000 amperes or 1000 volts with a current of only one ampere, the power expended will be the same; so, for the convenience of calculation, the term *watt* has been introduced to indicate the amount of electrical energy contained in 1 volt x 1 ampere. One horse power of mechanical

energy, which is equal to the work done per minute by one pound falling through 33,000 feet, or by 33,000 pounds falling one foot, is equivalent to 746 watts. This means that if we could convert directly, without any loss through friction or any other imperfection, one horse power of mechanical energy into electrical energy, we should obtain 746 watts. As we can subdivide the watts into amperes and volts at our discretion, so we could at will obtain either 746 amperes at one volt pressure, or one ampere at 746 volts pressure, in exchange for our horse power, or any two factors of volts and amperes which multiplied together produce 746. In practice, the best modern dynamos waste in conversion from 2½ to 5 per cent of the energy put into them as motive power; in other words, it is possible to obtain from 95 to 97½ per cent of electrical energy from a dynamo absorbing 100 per cent of mechanical energy to drive it.

A Paper Barrel.

An English concern has begun the manufacture of what is practically a paper barrel, and in which manufacture any waste material of a fibrous nature, such as cotton, paper and leather waste, etc., may be used, thereby turning into money much that has heretofore been discarded. The material to be used is first sorted over and then reduced to a fine pulp by being passed through a pulping machine, which consists of a beater operating in a circulating tank of water. As fast as the pulp assumes a proper degree of consistency, it passes from the pulp machine to the floor below, where it is received by an accumulating tank in which is placed the apparatus for forming the bodies of the barrels. In this tank the pulp is transformed from a semifluid to a solid mass by impingement with an endless traveling blanket which picks up the pulp and allows the water to drain off through its pores. On the upper side of this blanket, and in contact with it, are placed at intervals the cylinders upon which the barrel bodies are formed.

These cylinders are provided with sheet metal cores, which are arranged with allowance for expansion and contraction, and upon the surface of these cores the pulp is deposited from the blanket. As the pulp accumulates upon the upper cylinder, it is compressed by means of a pressure roller, under the blanket, and in a direct line with each cylinder. After a lapse of, on an average, four minutes, a sufficient accumulation of pulp has been made on the cylinder and the latter is withdrawn, metal core and all, leaving the barrel body ready for drying. Hot air prevails in the drying-room and is circulated by a blower, and in this room the barrel remains for a day, after which it is dampened and shaped under hydraulic pressure from a hydraulic main, to which the water is admitted under the previously mentioned pressure. This barrel is subject to this pressure until it has been set to the desired form, when it is then dried and finished. The making of similar barrels has been tried in this country with lack of success, in a measure owing to the difficulty experienced in removing the newly formed body from the core. This difficulty is overcome, however, by the ingenious contracting core.

Paint for Exposed Metal.

Red lead, so largely used by engineers, is an oxide of lead, usually in the form of bright red powder, which is not affected by water, but evolves the smell of chlorine when boiled with hydrochloric acid, and is slowly converted into chloride of lead. Dilute nitric acid only partly dissolves it, leaving a brown powder. On account of its durability it is frequently used as a priming coat, often the only coat used on iron-work. Care should be taken that no salt is present, otherwise a chemical action commences, blisters are formed, and the lead is reduced to a metallic condition. It has been proposed to substitute for red lead a pigment obtained from a sulphide of antimony, termed antimony vermilion, which is sold in a state of very fine powder, without taste or smell, and which is insoluble in water, alcohol, or essential oils. It is but little acted on by acids, and certain engineers state that when ground in oil it acquires great intensity or brightness of color, that it has a good body, is unalterable by air or light, and may be freely mixed with white lead. Black paints made from the residual products obtained in distilling coal and shale oils are largely employed for rough work. They combine readily with drying oils, and give an intense and handsome black, which is at the same time very economical. Native oxide of iron has of late years supplied us with a paint which possesses many of the good qualities of red lead, without its incon-

veniences. Oxide of iron paints are most effective and durable paints to use on iron, as they have no tendency to change or affect the surface of the metal. An analysis of one of these paints gives peroxide of iron, 68.95; aluminous earth (clay), 1.48; burnt clay, 29.57; total, 100. The purple brown oxide is a hydrated peroxide of iron.

Under equal volumes, iron paint covers more than those from lead; mixed with one-third of white lead it forms an excellent mastic, similar to that made from red lead, and which becomes very hard after drying for some time. As the iron oxide of paint resists a strong heat, it is advantageously employed for painting parts of machines and boilers. The so-called anti-corrosive paint is made of equal parts by weight of whiting and white lead, with half the quantity of very fine sand or road dust, with colors at pleasure. The mixture being made with water can be used as a water color, but it is usually applied as an oil paint. The preparation of oil recommended for this purpose is 12 parts by weight of linseed oil, raw; one part boiled linseed oil, and three parts of sulphate of lime, the whole well mixed. One gallon of oil thus prepared is used to seven pounds of the paint. Paints containing silica have been used for both wood and paint; they give a hard substance which is very durable; it is stated that when mixed with proper oils they will resist the action of salt water or acids better than iron or lead paints, that they cover well, and that in case of wood they form a considerable protection against fire.—Gas Fitters' Review.

SCIENTIFIC PROGRESS.

Sirius.

Andrew Grieg, Tayport, Scotland, contributes to the Astronomical Society of the Pacific (San Francisco) the following paper on "Sirius":

This is the most brilliant star in the heavens, and is sometimes called the leader of the host of heaven. It lies under the beautiful constellation of Orion, and a little to the left hand. Its splendor is so great that it has been perceived at mid-day with a telescope of half-inch aperture, and it has even been seen with the naked eye in broad sunshine. It is one of the stars whose parallax is unknown, and consequently its distance. The recent determination of its parallax by Dr. Gill, Royal Astronomer at Cape of Good Hope, shows Sirius to be much nearer than it was formerly believed to be. Its distance is equal to about nine light-years. Dr. Huggins, the eminent Spectroscopist and President of the British Association, tells us that the nearest star is so far off, that if it were approaching us at the rate of 100 miles per second, a whole century of such rapid approach would not do more than increase its brightness by the one-fortieth part. Photometric observations, combined with its ascertained parallax, show that Sirius emits from 40 to 60 times the light of our sun.

The old astronomical methods cannot tell us if the stars are coming directly toward us or going directly from us. The spectroscopic here comes to our aid, and enables us to find the motion of a star in the light of sight. It can measure the speed of approach or of recession of a heavenly body with very great accuracy—probably to about a mile per second. The early spectroscopic observations at Greenwich seem to show that Sirius recedes from us at one time with a velocity of 22 miles per second, and at another time is coming toward us at the same rate, as it moves in an elliptic orbit.

Certain minute changes in the motions of this brightest of all stars induced Bessel, the famous astronomer of Königsburg, to suspect the existence of some, as yet unseen, companion sun, whose disturbing influence might account for the unusual displacements. Auwers, another astronomer, calculated the probable elements of this unseen disturbing mass. Ultimately, a companion star was discovered by Mr. Alvan G. Clark (maker of the object glass for the great Lick telescope), by means of the refractor of 18½-inch aperture made by himself. This excellent instrument now belongs to the Observatory of Northwestern University. The companion, though at least one-tenth as heavy as Sirius itself, can only be seen under favorable conditions, for its light is not more than one-12,000th part of that emitted by Sirius.

ELECTRICITY AND WHITE LEAD.—Ammonium acetate is used for dissolving the litharge in the production of basic carbonate of lead—the so-called "white lead" of commerce. The solution is ordinarily used over and over again, and in course of time becomes impure through taking up considerable quantities of copper—an im-

purity in the litharge. One of the latest improvements employs carbonic acid gas for removing every trace of metal from the acetate, but another improvement, which is said to be even more effective, is to pass through the solution an electric current, electrodes of carbon being employed. In another application of electricity to white lead making, the metallic lead itself is decomposed in an acid electrolyte into an oxygen bearing salt of the metals; the saturated solution being then neutralized, and the salts contained in it being converted into hydrated lead carbonate. The latter is precipitated by the introduction of carbonic acid gas.—Electric-al Engineer.

Improvements in Photolithography.

Some improved photomechanical processes have just been patented by Dr. E. Albert, of Schwabing, near Munich. The first improvement relates to the construction of line plates used for "breaking up" the photographic image. These plates are themselves photographs of gratings, having from five to eight diagonal opaque lines to the millimetre. The lines are ordinarily of uniform breadth and opacity throughout the plate; but Dr. Albert, by giving a slight movement to the lens, causes these lines to blur or shade off at each side from a narrow central black band to a comparatively broad band embracing all gradations of shade down to an edging of very slight density. If (for an example) this plate is to be employed in photolithography, it may be placed on a sensitive surface in a copying camera, with a negative of the subject to be photolithographed. In the high lights, practically the whole width of the graduated hands will be effective in shielding the sensitive surface. In the shadows, on the other hand, only the central or blackest parts of the lines will be effective. Hence, in the finished lithograph, the diagonal lines, represented by white paper, will be broadest in the high lights, and narrowest in the deep shadows, with, of course, intermediate gradations of thickness—which is doubtless a very valuable result.

Another device patented by Dr. Albert, is the disposition of the lines on photochromic printing blocks in directions making considerable angles with one another. All the lines upon each plate are parallel *inter se*, but make an angle with those upon the other two plates of about 30°. This obviates the formation of those striking patterns (due to distinction between optic and pigment mixtures of colors) that are seen when color plates with parallel rulings get slightly out of register.

ANOTHER OIL GAS PROCESS.—An oil gas process invented by C. H. Wilder, and now in operation at Chelsea, Mass., has in the way of apparatus three cylindrical retorts, each five feet long and 14 inches in diameter, inclosed in brick work. The first is an open cylinder, affording an unobstructed passage. The second and third are supplied with a series of diaphragms between two and three inches apart, through which and over and around which the gas is obliged to pass on its way to the cooler and holder. About eight feet beyond the third retort stands the cooler and hydraulic main. The process, in brief, consists of the introduction of the crude oil into the first retort from a tank in which a percentage of water of a certain temperature has been forced to facilitate the flow of the oil. In this retort it is immediately volatilized. Almost simultaneously a volume of air is injected into the retort from a blower. This is also heated to the same degree of temperature as the vapor from the oil, and both readily assimilate. The air, acting as a pressure, forces the gas through a five inch pipe into the second retort. Here it passes through and over the series of diaphragms in the second and third retort, where it is similarly treated. In this retort the gas is thoroughly fixed. The diaphragms in the second and third retorts, as well as all the pipes and cylinders, are perfectly carbonized—a fact which prevents the gas from coming into contact with any heated metal, consequently there is no destruction or loss in transit. Through a six-inch pipe the fixed gas is carried from the third retort to the purifier and cooler, and hence into the holder outside the building, where it is stored for use.

INSECT ILLUMINATION.—The Secretary of the Smithsonian Institute, Prof. Langley, has been recently experimenting with Cuban fireflies, with view to discovering the manner in which the illumination they emit is generated. He says that the light that they give is the "cheapest" in the world—produced, that is to say, with the least heat and the smallest expenditure of energy—and he believes that a successful imitation of it would prove a most profitable substitute for

gas or electricity. The insects are beetles two inches long, and belong to the family of "snapping bugs," so called because when one is laid upon its back it snaps itself into the air with a clicking sound. The secret of the light this firefly gives is as yet undiscovered. Apparently it is connected in some way with the mysterious phenomena of life, and chemists and physicists have sought in vain to explain its origin. On each side of the animal's thorax is a luminous membranous spot, and these flash at intervals, so that the Cubans put a dozen of the insects in a cage together, and so obtain a continuous illumination bright enough to read by. This light is accompanied by no perceptible heat, and is seemingly produced with almost no expenditure of energy. How great an improvement it represents upon all known artificial lights can be imagined when it is stated that in candle light, lamp light, or gas light, the waste is more than 99 per cent. In other words, if they could be so obtained as not to throw anything away, they would give nearly 100 times the illumination which they do afford. Even the electric light is mostly waste.

THE NEW UNIT, KELVIN.—The English Board of Trade has just decided that the commercial unit of electricity formerly known as the "Board of Trade unit" is hereafter to be called a "kelvin." The unit itself is one kilowatt hour, that is, 1000 watt hours, and its new name is the present title of the well-known Sir William Thomson, now Lord Kelvin. Some people object to naming units, says *Electrical World*, but they fail to give any good reasons and are quite ready to make good use of such units when they find out the time, paper, ink and patience it saves to replace a sentence by a single word. Their unfavorable criticisms need not, therefore, be considered. No one can object to the well deserved honor done to Sir William Thomson by thus naming an important electrical unit; it seems a pity, though, that the name "kelvin" was chosen in place of "thomson," as that eminent gentleman has gained his world-wide fame under the latter name, and many will never know who the present name, kelvin, refers to. But the unit has been named by parties who have doubtless considered all the points, and our best plan is to join hands with our English friends, and adopt with them this new name in the same way that they accepted our unit, the henry. The coming Congress in 1893 would do well to officially adopt this name and stop all petty disputes which may arise between others who think that their views must be the only correct ones. Those who object may still continue to write the euphonious name "kilowatt hours;" nobody but they themselves and their stenographers are the losers.

ELECTRICITY.

Electro-Magnets.

A very important factor to be considered in the construction of an electro-magnet, says *Electrical Age*, is the length of the coil and of the core, as compared with the diameter. It is generally conceded that the maximum or outside diameter of coil should not exceed three times the diameter of the core, and while it has been said that the best results will be obtained by having the length of the core six times its diameter, there does not appear to be any universal reason for such a proportion. In a bar-magnet, however, where there is a desire to employ but one pole only, and get rid of the effects of the other, a decided advantage is to be gained by using a core of much greater proportional length, and should there be any restrictions as to the amount of wire to be used, fewer layers can be wound over a long piece of iron than would be over a shorter one. In this way the distance between the iron and the wire would be reduced, and having the same resistance the number of lines of force would consequently be correspondingly increased. If the same proportion were to be maintained between the respective diameters of the lengthened core and its coils, and the gauge of the wire so increased as to maintain a constant resistance and constant number of turns, the polar strength developed close to one end of the core will vary as the square of the length of the core—that is, if the core is not lengthened so extensively as to permit a leakage of the lines of force at the sides of the coil. This limit will vary with different qualities of iron in accordance with the relative permeability, or in other words, capability of conducting lines of force.

The above description treats only of electro-magnets in which the wire has been evenly wound its entire length; but for some

purposes it is preferable to vary the method of winding.

We will suppose, for example, that it is desired to construct a bar-magnet which shall develop close to its extremities a very powerful field, and yet at the same time not exert any force at a comparatively greater distance. In such a case it should have the wire coned up near the ends; that is to say, it should have a larger layer of wires over the ends, the number gradually decreasing toward the middle and with few or none being wound over the central position of the core. As a rule, the wire should not, at any point be wound more than three times the diameter of the core. In such a magnet the lines of force will be powerfully developed near the ends and have but little tendency to leak out. On the other hand, much smaller curves will be made than would result from an equal length of wire wound evenly along the entire length of the core.

STREET CARS.—While it is true that the propulsion of street-railway cars by electricity, may, after five years experience be pronounced a success from the point of view of public accommodation and convenience, it must nevertheless be admitted that from the street-railway manager's standpoint this success cannot truthfully be regarded as an unqualified one. While electric power has unquestionably demonstrated itself to be an advance, not merely upon the use of animals, but upon the use of any other power whatsoever which has been proposed for the purpose, its practical application has been accompanied by many serious drawbacks. An individual who had just emerged from a protracted litigation once remarked that the only property the lawyers had left him was his post-office address, and it has been said with equal truth that in the conversion of a horse railroad into an electric line, oftentimes the sole item remaining of the original property is the franchise. The first electric motors were found to be far too light for the work they were required to do; when these were placed by heavier ones the original cars proved too weak to stand the strain; then the new cars were so heavy as to be ruinous to the track, and so it was necessary to completely reconstruct that, and so on. For the first year or two the cost of repairs and maintenance of motors, and the losses incurred by breakdowns, constituted a formidable item, but this having been overcome by increasing the strength and weight of the motor machinery and the adoption of the so-called gearless design, the trouble has broken out afresh—this time in the track. The destructive effect upon the rails of some of the methods of mounting motors now most in vogue is little short of appalling.—*Engineering News*.

WEAVING BY ELECTRICITY AT BLACKBURN.—A Blackburn paper (England) states that the experiment of weaving by electricity was last week for the first time tried with perfect success, at the loom works of Mr. Henry Livesey, Limited, Greenback, Blackburn. The works are illuminated by electric light, the electricity being generated by a large dynamo, and taking advantage of this installation a motor has been fixed in one of the upper rooms by Mr. Thomas Barton, of Blackburn, and drives the identical loom which secured to Mr. Livesey the medal at the Paris Exhibition. This loom, of which there are hundreds of facsimiles running in Blackburn mills, has what is known as a 44-inch reed space, and with the electric power is being worked at the rate of 210 picks per minute. The motor is large enough to drive a greater number of looms, so that a higher speed than this might be attained if desired. Of course there would be no advantage in driving a large number of looms by electricity, but where there is an installation of electricity for lighting purposes, a few looms may be worked to advantage by electricity. Again, any one having the electric light laid on to his house might, with the aid of a motor, run a couple of looms.

AN ELECTROMAGNETIC LIGHT COIN DETECTOR.—Messrs. Napier & Son show at the Crystal Palace Exhibition an electromagnetic light-coin rejector for the use of bankers or mints. The coins are pushed in succession from the balance pan on to a knife-edge, and according as this knife-edge is at the right-hand limit of its range, or the left-hand limit, the coin, when pushed on it, tilts off to the "light" channel or the "full weight" channel as the case may be. The right or left position of this shifting knife-edge is determined by an electric contact made by the balance beam. This brings an electromagnet into action. The coins are run through the machine at the rate of about 60 per minute by the action of turning a handle.

GOOD HEALTH.

How Leprosy is Spread Wholesale.

Much alarm has been expressed of late at the recent rapid spread of this loathsome and fatal disease in India, in many British Colonies, the Sandwich Islands, Norway, and elsewhere. A correspondent of *Discovery* says:

The following appear to be undoubted facts. 1. The disease is hereditary, the descendant of a leper almost invariably being attacked by the disease, though it seldom appears until the age of 15, and sometimes long after. 2. The children of apparently healthy parents, who a few years after giving them birth have become lepers, nearly always become lepers themselves, showing that the disease is long resident in a person, and can be transmitted to his or her children before it makes its appearance. 3. Attendants of leper hospitals very rarely contract the disease, and have no fear of handling the patients, so long as they have no cuts on their own fingers. 4. It is rapidly spreading in several countries, in a manner that cannot be accounted for by inspection, and in a manner unknown in the history of the disease, prior to this century, and in ways that cannot be accounted for, either by contagion or infection. 5. No well-established cure has been discovered for it. 6. It resembles syphilis in many of its characteristics, and can be propagated in a manner similar to that disease, but this accounts for but a very small part of its late abnormal spread. 7. It can certainly be propagated by inoculation, and there are many acknowledged instances in which it has been spread by ordinary arm-to-arm vaccination, the lymph having been obtained from the arm of some person just beginning, unknown even to himself at the time, to suffer from leprosy.

What inferences can we gather from the foregoing data? 1. That a man may be an actual and potential leper and capable of being a propagating center of the disease years before there are recognized leprosy symptoms. 2. That many are thus born potential lepers. 3. That there is no known way of diagnosing these from others. 4. That the disease can be by inoculation, or arm-to-arm vaccination be spread from potential lepers to other persons.

On grounds like these it has been suggested, and we think it is highly probable, that arm-to-arm vaccination is the true cause of the rapid spread of leprosy and that it should be totally suppressed by law in those countries at least where leprosy exists.

The Measles Bacillus.

Dr. Canon and Dr. Pielicke of the Moabit Hospital, the former of whom was one of the first to demonstrate the presence of the influenza bacillus in the blood, have now turned their attention to measles, and it is reported that they have been so far successful that they have been enabled to demonstrate the presence of a specific bacillus in connection with this disease.

This discovery has naturally attracted considerable attention; for although *a priori* we should expect measles to be the result of the action of such a germ, we have hitherto been unable to associate it directly with any such causal agent. In 14 patients they have succeeded in finding what they assume to be a specific bacillus in the blood, in the expectorations, and in other secretions. This bacillus is stained with methylene blue in the same way as the influenza bacillus, the coloration being specially intense at the ends. The different individuals differ considerably in length, being from one-three-thousandth to one-one-thousandth of an inch. Its characteristics are said to be different from those of any other bacillus known, and artificial cultures have already been obtained. If once we are enabled to study the life history of this organism, there seems to be a possibility that we shall be able to take some efficient steps in the protection of children against this disease. The further observations on this organism and on its power of producing the disease will be awaited with additional interest from the fact that it appears to be so like the influenza bacillus in its distribution, and also to a certain extent in the effect it produces, in spite of the fact that it is very different in structure and appearance from the influenza organism.—*Lancet*.

TREATMENT OF RHEUMATISM.—It seems as if everybody is complaining of rheumatism nowadays, young and old, rich and poor. Science, ever ready with something new to alleviate the sufferings of mankind, has not failed in this direction, and salol is now the remedy extensively used for rheumatism. The *Medical Times and Register*

says: "Therapeutically, the anodyne property of salol is exhibited in the cases that are rheumatic in source." The first triumphs of salol were won in the treatment of acute rheumatism, excelling, as it apparently does, all other remedies in its power to abate and lessen fever. If all the conditions be propitious, by the end of the second and third day, fever and joint pain and swelling will have disappeared. Salol has a further use, in that it is antiseptic, and excellent results have been obtained from it when used as a disinfectant for the bowels in cases of cholera, typhoid fever, etc. In connection with the cure of rheumatism, it may be stated that of late years massage treatment has found great favor with rheumatic patients. In practicing massage, the fingers are usually moistened with some sort of oily preparation, and for this purpose nothing better can be used than lanoline. Many physicians consider this vastly preferable to vaseline or any other preparation, and its use has invariably been attended with the greatest success.

USEFUL INFORMATION.

COLORING BRASS.—The following method is given for coloring brass: One hundred grammes of carbonate of copper and 750 grammes of ammonia are introduced in a decanter, well corked, and shaken until solution is effected. There are then added 150 cubic centimeters of distilled water. The mixture is shaken once more, shortly after which it is ready for use. The liquid should be kept in a cool place, in firmly closed bottles or in glass vessels, with a large opening, the edges of which have been subjected to emery grinding and covered by plates of greased glass. When the liquid has lost its strength, it can be recuperated by the addition of a little ammonia. The articles to be colored should be perfectly clean. Especial care should be taken to clear them of all trace of grease. They are then suspended by a brass wire in the liquid, in which they are entirely immersed, and a to-and-fro movement is communicated to them. After the expiration of two or three minutes, they are taken from the bath, washed in clean water, and dried in sawdust. It is necessary that the operation be conducted with as little exposure to the air as possible. Handsome shades are only obtained in the case of brass and tombac—that is to say, copper and zinc alloys. The bath cannot be used for coloring bronze (copper tin) and other similar metallic alloys.

SELENIUM.—Selenium is a nonmetallic element, and, in some respects, resembles sulphur and tellurium. As used for electrical purposes, says the *Optician*, it is crystalline in structure, brittle and black. Its most remarkable property, however, is the variation of electrical resistance under light rays. This property of selenium was discovered in 1875 by Willoughby Smith, a prominent English electrician. It is an extremely poor conductor, its resistance, according to Sylvanus Thompson, being very much greater than that of copper. Under the influence of light, however, its resistance varies directly as the square root of the illumination. The "selenium cells," recently constructed by Prof. Alexander Graham Bell and Mr. Sumner Tainter, consisted of narrow strips of selenium placed between the edges of broad conducting plates of brass. By this method of construction, a reduction of transverse resistance and a large amount of surface for exposure to the action of light was secured. In the dark this cell had a resistance of 300 ohms, and when exposed to sunlight the resistance fell 50 per cent, or to 150 ohms.

SAFETY LAMP.—The *Colliery Guardian* notes an invention patented by Mr. W. Allott and Mr. T. Fairies, of Chapeltown, the object of which is to protect the eyes of miners while using safety lamps. This it does by preventing the light from the lamp from shining directly upon the workman's eyes. The inventors claim that this can be done while focusing the rays upon the precise spot required. A shield of enamel is made to cover about three-eighths of the surface of the glass cylinder that protects the flame. The enamel subdues the rays of light, and at the same time acts as a reflector.

A NEW use has been found for diamonds, in assisting marksmen in their shooting. The cut stones are fixed in the front and back sights, and it is said that they enable the gunner to take a quick and correct aim, even when the light is bad. The brilliants are so fitted that as soon as the gun is brought to the shoulder, the rays in the gems assist alignment, and the eye takes aim without the least hesitation.

The Cyanide Process.

The announcement that we should shortly publish a special edition of the MINING AND SCIENTIFIC PRESS relating to the MacArthur-Forrest or cyanide process, has already resulted in orders for several hundred extra copies, showing the wide interest felt in all details concerning this method of the treatment of ores. It is our intention to publish this special edition on July 2d, and the matter for it is now in course of preparation. We should be obliged to correspondents who will send us in any personal experiences with the process. The object of the special edition is to gather everything of interest on the subject for handy reference. With this in view some articles which have already appeared will be reprinted, but most of the matter will be fresh in nature. Diagrams and plans will be given for arranging a plant on this system, together with such details as will be of interest and value to metallurgists and miners. Orders for copies of this edition should be sent in at once.

A new flume 45 miles long will be built in Fresno county. Its purpose is to reach the Birmingham tract of timber, containing 10,000 acres, belonging to a large lumber company of Michigan. This flume will interfere with none now in operation, but will develop the new region beyond Crane Valley, one of the wealthiest bodies of pine in the Sierra Nevada range.

An Anti-Debris Convention.

As announced in the PRESS of last week, an Anti-Debris Convention occurs Friday, June 10th, at Sacramento, when certain farmers and citizens intend protesting against the passage of the Caminetti bill, on the ground that the farmers are opposed to impounding dams; that they have never made any concessions to the miners; that the miners have violated their pledges by continuing illicit mining; and that the position of the farmers has been misrepresented in Congress and elsewhere.

It is not worth while to reopen the discussion on this debris question in its general features. It has been a subject of controversy for many years. The courts decided against the miners, and they had to accept the decrees, whether they wanted to or not.

But, after a time, it was found that the gold from the mines was needed in California. Many of the towns became depopulated, and the hydraulic mining industry, with all the capital invested, was practically wiped out. Public opinion became more favorable to the miner when it was found he was willing to impound the debris which had done the damage, and the farmer could have no cause of complaint if that were done.

At the State Miners' Convention in January last, acknowledgment was made of the damage done, and it was conceded the business of hydraulic mining could not continue unless the debris was kept out of the rivers and off the farming lands. The legislature of California had asked Congress to settle this question, and it appointed a Board of Engineers to examine the matter. This Board reported that, under certain conditions, dams could be built which would restrain the debris. With this report as a basis, the miners appealed to Congress for aid. The representatives of the farming counties present at the convention, when they saw the miners were earnestly endeavoring to do something to prevent the damage from their operations, lent their assistance. A memorial and resolutions were adopted and submitted to Congress. The farmers were not asked to give up any rights under the decrees of the courts, and gave up no rights. The valley people simply withdrew active opposition on finding the miners were willing to do what was right.

On this basis the Caminetti bill was drawn. It has been reported back by the committee and is on its way to passage. It is unjust on the part of the valley people to oppose it now under the circumstances. It permits the miners to build dams under Government supervision, and the miners must pay for them by returning three per cent of gross yield from mines benefited. No one pays the expenses of the dams except the miners.

This whole thing has been brought about by certain individual miners continuing to work when they should not have done so. This was foreseen by the Miners' Association, but that body is powerless to prevent it. The Anti-Debris people have not been able to prevent it, and the Government has not been able to. The Miners' Association officially asked the miners to stop mining, and have repeatedly urged compliance with the request. That is all they can do.

As to misrepresentation of the farmers' position, that is a mistake. The resolutions of the Miners' Association, published elsewhere, show how they feel on that subject.

It is to be hoped that the representatives of the valley counties, who were at the Miners' Convention, will attend the one at Sacramento and explain to the gentlemen assembled that the miners have tried, and are trying, to do what is right; and also explain that the farmers have not been misrepresented. As to the utility of impounding dams, the engineers having reported favorably upon them for the purpose specified, any lay opinion from farmer or miner is of

no moment. But it will be detrimental to the interests of this State should the Sacramento convention do anything to prevent a settlement of this long-fought debris question, now that Congress has it in hand.

Turn the Mills Over to the Mines.

In compliance with the request of the Mining Stock Association, the Potosi Silver Mining Company of the Comstock lode has kindly furnished the stockholders of the company with the car sample assays. The secretary of the company, Mr. Chas. E. Elliot, with that zeal for the interests of the stockholders of the company, for which he is noted, has taken the trouble to obtain, for these stockholders, the car samples showing the value of the output during the month of April, as well as the month of May. This is very commendable, and the example set by Mr. Elliot should be followed by other secretaries, as the month of April is the first month of the second quarter of the year, and, with this data, stockholders in the various companies producing ore can easily see what is being done.

An analysis of the report of the working of the ore for this company during the month of April does not make a very creditable showing for the Nevada mill, which reduced it.

It is well known among expert millmen that the ore of the Comstock can be worked up to 90 per cent of the pulp assay, but in the working of the Potosi ore, the mill returned but 78 per cent of this pulp assay. It is presumed that the "three-pan annex" attached to this mill, and which was so thoroughly advertised in the Hale & Norcross case, must be supplied with grist to grind, and the 12 per cent difference, which went to fatten the slimes and concentrates, went to fatten the output of that part of the mill. A statement of the working of the Potosi mine is given below, and from it the stockholders in that property can see where \$4433.50 of their profits went.

POTOSI MINE.			
	Car Sample.	Battery Sample.	
April 9.....	\$26.30	\$24.38	
April 16.....	31.12	27.52	
April 23.....	22.89	23.25	
April 30.....	22.76	21.82	
Average.....	25.77	24.24	
May 7.....	25.57	25.34	
May 14.....	23.86	24.65	
May 21.....	22.62	22.18	
May 28.....	18.98	21.19	
Average.....	22.75	23.34	

APRIL WORKINGS OF POTOSI MINE.	
Tons worked.....	1,478
Bullion returned.....	\$27,810.46
Cost of reduction, \$7 per ton.....	10,346.00
Net proceeds.....	17,464.46
Average assay value of pulp.....	24.18
65 per cent of pulp assay is.....	15.71
Gross average returned per ton.....	18.81

Per cent saved of battery assay.....	.78
Should be returned 90 per cent of battery sample value (\$35,826.72).....	32,244.05
Amount actually returned 78 per cent.....	27,510.46
Amount kept by the mill for month of April \$4,433.59	

It is a pity that the directors of this company persist in entrusting ore to a mill with such an unsavory record as the Nevada mill, which is under the management and control of the parties who have been found guilty of conspiring against and defrauding the Hale & Norcross Mining Company. Such acts can lead to but one termination, and that is judgment criminally and civilly for the full amount which may be lost to the stockholders through the passive assent of these directors to the looting of the mine.

There apparently is but one way to relieve the ore-producing companies on the Comstock from the attacks and looting of the millmen, and that is by turning the mills over to the mines.

No honest millman and mine manager will object to this and the sooner it is done the better.

As long as the owners of the mills control and pay the assayers at the mines, just that long will there be a question as to assays.

It is notorious that these assays can be manipulated to suit the mill owners, and there is no certainty that it is not now done, as it is positively known that assayers have had instructions to "strike off" a certain number of "points" as suited the convenience of the millman.

These little irregularities can all be corrected by turning the mills over to the mines. It should be done at once.

Another point of interest in this analysis, is the fact that for April there is only a difference of 5.9 per cent between the car sample and the battery assay. In May the average battery assay exceeds the pulp assay 59 cents. In view of the testimony given in the Hale & Norcross case that there was a difference of \$10 per ton between the car sample assay and the battery assay, these figures are very significant. The fact that the mill took 26.88 per cent of the pulp value of the ore is also a matter of interest to the stockholder. The average pulp assay of the ore was 24.18 while the net average return to the company was 11.81, showing a loss of \$13.96 per ton between the time of the delivery of the ore to the mill and the return of the bullion to the company. Where did this go?

The secretary of the company should make an explanation of this loss to the shareholders of the Potosi Company.

Miners' Association Resolutions.

On Friday last the Executive Committee of the California Miners' Association met and passed the following resolutions:

WHEREAS, At a mass meeting at Colusa on May 30th certain resolutions were adopted in reference to hydraulic mining and its effects, denouncing the Caminetti bill, now favorably reported on and pending in Congress, stating that the position of the farmers and citizens of the valley has been misrepresented at Washington and elsewhere, and that the farmers have never admitted in any shape that they were willing to make concessions, but have stood and still stand squarely on the decision of Judge Temple of the State Court and Judge Sawyer of the United States Circuit Court; and

Whereas, A convention of the valley counties has been called for June 10th at Sacramento to consider these resolutions and take action on the Caminetti bill; therefore be it

Resolved, by the California Miners' Association, That we regret this action on the part of misinformed citizens attending the mass meeting at Colusa, since this Association has never represented that the farmers have abandoned any rights under the decrees of the courts, but, on the contrary, have endeavored to act in harmony with them in preventing further damage from mining debris, by advocating and urging the plans suggested by the Government engineers appointed by Congress to inquire into this question and suggest plans for stopping the damage.

Resolved, That we have never represented that the farmers had abandoned their position toward hydraulic mining debris, nor asked nor expected them to suffer hydraulic mining to go on without suitable restrictions where there was liability of damage, but have asked their assistance on legislation which would prevent the damage complained of in the past.

Resolved, That we have urgently requested all miners to desist from illicit mining, and sincerely regret that any individuals have continued such work, and that we reiterate the sentiment expressed in the resolution passed by this body on January 30, 1892, in relation to this matter, viz.: "That it is the sense of the California Miners' Association that such persons as may start their monitors in the spring at places where damage is likely to result to streams or adjacent lands shall receive no aid or countenance in the future from this Association."

Resolved, That we consider that the Caminetti bill now pending in Congress will give relief to both sides in this controversy in that only those miners licensed will be permitted to mine, and only those can be licensed who are in a position to deposit the debris from their mines behind the impounding dams to be erected by and under the supervision of the Government engineers.

A Conference Committee was appointed as follows, to meet with the convention at Sacramento on June 10th to represent the California Miners' Association and to explain to the convention the position the miners maintain in regard to hydraulic mining: J. H. Neff (Chairman), Edward Coleman, Charles G. Yale (of the MINING AND SCIENTIFIC PRESS), John Hays Hammond, S. K. Thornton, Marion Biggs, W. C. Ralston and Judge Niles Seales.

THE business portion of Jimtown, the famous mining camp at Creede, Colo., was destroyed by fire on Sunday morning. The flames were started by an explosion of coal oil. In a short time the fire burned through rows of frame buildings for a distance of a mile. Many houses were blown up with giant powder in an attempt to stop the fire, but to no effect. The entire area between the school section and Upper Creede is now a mass of smoldering ruins. The loss is fully \$1,000,000, and there is not over \$150,000 insurance all told.

Chinese Silver-Lead and Copper Mines.

In presenting the conclusion of Mr. Ellis Clark's paper on "The Progress of Mining in China," maps are given of the Je-Hol silver-lead district and the Ping-Chuan-Chao copper district. The mines of Yen-Tung-Shan, with some others, constitute the Je-Hol mining district, opened in 1887 under the direction of Prof. John A. Church. The mines had previously been worked by the Chinese themselves without outside direction. After reaching depths of 100 to 150

The smelting at Yen-Tung-Shan is still carried on in the Chinese way, an account of which may be found interesting. This metallurgical process consists of three operations—roasting, smelting with litharge to concentrate the silver in a bar of lead, and cupelling this bar of lead for silver. The roasting is done in an open heap, the ore being kept in place by loosely piled adobes. A comparatively high heat is produced, which results in driving off a portion only of the sulphur and melting the remaining sulphuret of lead into a matte.

fuel, is an exceedingly neat operation—sn oblong pile of slightly moistened wood ash, 2 feet long, 18 inches wide and 9 inches high, is made, and the test cut out with a hoop and pressed down with the foot. Twenty catties of lead are placed in the test, and half-bricks laid at intervals along the edge, with adobes covering them and the test, thus forming a muffle. A cone of charcoal is then built over the muffle, and this charcoal is used as the centering of a dome, built of mud and straw, which is plastered on the charcoal till it has a thick-

concentrating mill, designed and constructed by Frazer & Chalmers, equipped with boilers and a Corliss engine, a Blake coarse crusher, a Sturtevant mill, a Buchanan fine crusher, rolls, one three-compartment jig, two two-compartment jigs and a rotary buddle. The smelting works consisted at first of a 15-ton water-jacket furnace, and subsequently of a 40-ton furnace, with Baker blower and attached engine, dust-chambers and stack of boiler-plate and a cupellation plant.

The Ping-Chuan-Chao copper mines are situated 160 miles north-east of Tientsin, at the point marked on the route-map as Chu-Tzu (signifying "office"). The controlling feature of the topography is a valley 2300 feet above sea level, descending and broadening southward, and forking toward the north and west into a number of ravines which lead up to a divide, 2600 feet high, between two branches of the Lan-Ho. The mines of Hsiao-Liang-Hsi and Ta-Liang-Hsi (Little and Great West-Mountain) are on the western slope of this divide. Bounding the valley on the northeast and southwest are limestone hills, whose summits reach an elevation of 3000 feet.

The copper ore is found exclusively in the decomposed limestone belt, between the granite and the amygdaloid, in pockets and small seams somewhat after the nature of a stockwork. In the Yuen-Li shaft it occurs as a contact deposit between the granite and the limestone. The ore is a silicate of copper, containing some carbonate and occasional copper pyrites. It is smelted in a 36-inch water-jacket furnace with iron and lime fluxes which are found in the neighborhood, and with a coke carrying 20 per cent of ash.

The pig copper is refined by a native process, which consists in extracting the iron and other impurities by means of small quantities of lead in a hearth lined with Pekin anthracite. A hole measuring three feet cube is dug and lined with brick; the cavity is filled with anthracite-culm in which a basin is hollowed out and coated with a paste made of anthracite powder and water. A dome is then built over the basin

feet, the Chinese experienced difficulty with water, and were drowned out every rainy season. The vein is entirely in limestone slates, no ore having been found in the schists. Besides the main vein there are several flat or bed veins. The mine is now opened by a three-compartment shaft and gangways. The vein is about three feet wide with a much narrower pay streak running from 12 to 18 ounces of silver per ton where there is zinc blende; but with the galena it will run from 300 to 500 ounces per ton. The ore mined by the Chinese carries 28 to 57 per cent of lead and 54 to 300 ounces of silver per ton. Washings from waste ore carry little or no lead, but 16 to 80 ounces of silver.

The smelting is performed in two low crucible-furnaces built of clay, 2 feet 6 inches high, 12 inches inside diameter at the top and 18 inches at the bottom. The blast is supplied by a Fenghsiang or wind-box, worked by two men. The furnace-charge is made up of two piculs (133 pounds) of roasted ore, one picul of rich silver-slag from a former operation, and 60 catties (1½ pounds) of litharge either purchased or obtained from a previous cupellation. The product of one operation is only 58 catties of silver-lead, as a large portion of the lead and a considerable percentage of the silver go off in heavy clouds of smoke.

The cupellation, though performed on small quantities and being extravagant in

ness of two inches. The charcoal is then ignited; the lead oxidizes into litharge and is absorbed by the test, while more lead is added through the front opening; fresh charcoal is also added through a hole in the top of the dome, and after eight hours the silver brightens and the cupellation is complete. The two operations of smelting and cupellation consumed 200 catties of ore, 100 catties of rich slag and 60 catties of litharge, and yielded 58 catties of lead containing 31 taels, or 41 ounces, of silver.

The foreign management, under the energetic direction of Prof. Church, erected boilers and a hoisting engine supplied by the Union Iron Works of San Francisco, and subsequently built a 50-ton coarse-

with long crucibles serving as columns, and with lumps of anthracite, slate and clay. The hearth is rapidly dried and pig copper melted in the basin by means of wood fuel and blast from a wind-box. The fining is accomplished by constant stirring of the molten copper with an iron rod and the addition of small quantities of lead. The operation lasts from six to eight hours, whereupon the copper is ladled out and poured into molds, the ingots being immediately dumped into water. The copper is sufficiently pure for ordinary commercial purposes; it shows a fine silky fracture and is covered with deep rose-red oxide, so highly desired by purchasers. The native process is described only as a matter of interest.

the Means of All.

For Free Pamphlet and full
particulars, address

The Colliery Engineer School of Mines,
Scranton, Pa.

33 Sample copies of "THE COLLIERY ENGINEER,"
(by reading which hundreds of miners have qualified
themselves to become Superintendents and
Foremen), and catalogue of Mining Books sent free on
application.

THE ORIENTAL GAS ENGINE

IS THE BEST, because
it combines simplicity
of construction with
power and economy in
space. It can be run
with natural or manu-
factured gas or gasoline
at a cost of 20 to 25
cents per horse power
per day.
It can be used for
pumping purposes, as
well as for all purposes
where a perfect engine
is required, with the
advantage of lessening
the risk of explosions.
No licensed engineer at
a high salary needed to
operate it.
Send for circulars and
prices if a good safe en-
gine is what you need.

The Oriental Launch is Perfection.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 9, 1892.

As harvest work progresses, under favorable crop-maturing weather, the feeling of confidence in the future becomes more pronounced. With the return of confidence trade expands and capitalists are less disposed to hoard funds. It is now stated that accommodations are more readily secured from banks and outside capitalists. It is claimed that unless the price of wheat advances there will be large quantities warehoused and funds raised by hypothecating the receipts. Even with this large drain realized, the money market will still be easy. We are informed that considerable money has come and will come from Europe for investment on this coast; the high rates of interest ruling here make such investments quite profitable. The European money market is reflected in the following excerpt from a leading exchange in London: "The Bank of England rate remains at two per cent, and the Bank of France has lowered its figures from three per cent, at which it has stood for 3½ years, to 2½ per cent. The Bank of France now holds \$6,455,640 in gold, or about three times as large as the stock held in the Bank of England. In our own market, day to day loans have been offered at one-quarter to one-half per cent, and the discount rates have ranged from three-fourths to 1½ per cent, which are almost unprecedentedly low quotations. They show what a vast amount of money is awaiting employment, if only confidence could once more be effectually restored." The New York money market is reported easy, with a plethora of funds on hand. Persons offering gilt-edged security can be accommodated at a low rate of interest. A New York exchange, under date of June 4th, says: "The strength of the bond market, resulting from the glut of money and consequent low rates of interest, is the most important feature of the week. Purchases made on Saturday alone amounted to \$1,650,000, principally in Reading issues at an advance, and for the week the aggregate approached \$3,000,000. The abundance of money was again demonstrated by about \$5,000,000 further increase of the bank reserves, so that the surplus now amounts to \$24,594,000. The June disbursements will add to the volume of money seeking investment. Now that gold shipments have ceased and Europe is buying bonds instead of selling them, the financial horizon is supposed to be more cheerful."

The *Railway World* of New York, in referring to the June disbursements by the different railway companies, says: "While the amount of the interest and dividends to be disbursed will appear small in comparison with those of the coming month (July), yet they reach the amount of \$28,339,882, the par value of the bonds on which interest is due being \$57,738,556, while the par value of the stocks on which dividends are payable is \$152,972,296. The June disbursements of the character indicated, and the amounts on which payments are to be made, compare as follows:

	1891.	1892.
Bonds.....	\$50,967,571	\$657,738,556
Interest.....	17,782,603	18,118,176
Stocks.....	444,424,608	452,972,296
Dividends.....	9,978,237	10,221,705
Total.....	\$25,760,840	\$28,339,882

The low rate of interest no longer becomes a cause for surprise in the light of the above large disbursements, which are quite small when compared to the total sums which will be disbursed in next month.

SILVER—The markets at home and abroad show a steady appreciation. The advance has every evidence of being based on legitimate business requirements. With a continued improvement it is quite probable that a speculative demand will set in. If this demand does set in the large short interest abroad will undoubtedly run to cover, and, bidding against themselves, high prices must inevitably follow. A most remarkable change has been and is steadily growing, in the views of financial men and leading financial writers, regarding silver. The *Daily Indicator* of New York, which is an accepted authority on Wall street, has standing in large type a demand that silver be remonetized. The *New York Iron Age* which has been a strong gold bug organ, in its issue of June 2d editorially says: "The prevailing sentiment with reference to the free coinage of silver has undergone considerable change since the issue was pressed most vigorously upon Congress. It will be remembered that last autumn Robert Giffen was quoted in a London dispatch as authority for the statement that by February of 1892 the silver crisis so long impending in the United States would culminate in disaster. The prediction doubtless added to the apprehension already existing among foreign investors and financiers, so that American securities held in Europe were viewed with distrust. However that may be, large amounts were sent home for redemption in gold, giving increased volume to the eastward flow of the yellow metal from this country, despite the balance of trade was largely to the credit of this country on account of the extraordinary exports of grain to supply the deficiencies in Europe. It is exceedingly instructive to observe at this time that scarcely a ripple of disturbance remains, and that with a sense of restored security purchases of American stocks and bonds on European account are resumed on a liberal scale, forming a conspicuous feature in Wall street. One immediate consequence is that the rates of sterling exchange are so much advanced that exports of gold from this side are no longer profitable, and the feeling in the market is that as the season advances the European demand is likely to broaden rather than diminish." The above is strong evidence that a silver scare has no foundation in fact and that now with more radical legislation in favor of the metal the United States will not be a sufferer.

MEXICAN DOLLARS—The market is stronger, at around 7½ cts. The last steamship which left for China took out the following: For Hongkong, \$318,142, and for Yokobama, \$120,000.

QUICKSILVER—Receipts the past week, 603 flasks. The market is fairly active, with a good demand ruling.

BORAX—Exports by sea the past week aggregate 4030 cts, to New York. The market is steady, with

a fair consumption demand ruling here and at the East.

LIME—Receipts the past week, 7209 bbls. Receipts the past week were the largest in any one week in the history of the trade. The market is fairly active for building and other purposes.

PIG LEAD—The market holds fairly steady. The East reports a moderate business and a fairly firm market, with holders not disposed to shade prices.

PIG TIN—The market is firm here and at the East. It now looks as if the corner which is being run at the East will be a success. This opinion strengthens as silver appreciates. New York mail advices continue to report "bulls" buying all that offered on spot or to arrive.

PIG IRON—The market is reported slightly firmer but not quotable higher. The consumption is said to be larger than at any time within the history of the trade. Eastern and English advices are more favorable. It looks as if bottom prices for this year had been touched.

COPPER—The market shaded off slightly the past week, but the undertone to the market has considerable strength. *Iron Age* reports the New York market as follows: "All accounts go to show that the consumption in the manufacture of electrical supplies continues on a large scale, and that considerable quantities are being used for other purposes." English cables indicate that before long all differences, looking to controlling the output of all the mines, are liable to be settled at an early day.

COAL—Imports the past week: Comox 4300 tons, Nainaimo 4042, Tacoma 4007, Seattle 1223, Departure Bay 4070, Newcastle, N. S. W., 6668, Sydney 5070. Total 30,180 tons. The tonnage on the way from Australia is slowly increasing, but it aggregates about 40 per cent less than was on the way at the corresponding date in 1891. While the market is not quoted higher, yet there is a very strong tone, which is likely to result in better prices as the season advances.

Mining Share Market.

SAN FRANCISCO, June 9, 1892.

Mining shares the past week were lifeless and generally depressed up to Tuesday, when Savage began to show more life, which resulted in the shares selling up to \$3 on yesterday. While this activity is regarded on it is hard to say, unless it be the old trick of leading the public into another trap; but whether the pool will succeed remains to be seen. Times are somewhat changed now, and it may be that insiders can not run their little confidence game so successfully. There was a time, and that not far back, either, when a few dollars or political influence controlled courts and juries. With voters at large awakened to a keen realization that courts of justice are, as a rule, that only in name, but rather are, generally, courts for legalizing robbery, a change will set in when even poor, but honest persons, will be able to have wrongs righted. With this change, conspiracies by those elected to offices of trust in any incorporated company, can and will be punished by having the guilty sentenced to serve a term of years in the penitentiary and at the same time made to pay back funds misappropriated through fraud or otherwise.

To bring trustees or directors up with a round turn, it is only necessary to have ten or more shares put in the name of the person who wishes to bring suit. The person having ten or more shares standing in his or her name in the books of any company, can determine in writing that the laws under which the company is incorporated, be conforming to, and the directors or trustees failing to have it done makes each director or trustee liable in the sum of \$1000 to the person, which sum can be secured by bringing suit. This is the decision of the Supreme Court of this State. It is good law and will stand, even if there be one or more judges who hunt for ways and means to reverse the ruling of the highest court in this State. There is no other way by which a person can make more money than by bringing suit against the directors of mining companies which fail to have their superintendents furnish weekly letters fully conforming to the law under which the company is incorporated.

Not only is that the present little spurt in the market is due to the mill rings, which for years have been looting the Comstock mines, realizing the full extent of the position in which they are placed, and have determined to secure at least two-thirds of the shares of the mine marked for looting. To get the shares, they are now in the market as buyers. If this should be the case, then were to outsiders who hold shares after the ring has bought all the shares wanted, for it will be only assessments and low prices afterward. The mill ring controlling a mine sending ore to a mill, can have poor rock selected for assay, and the "little joker" at the mill will take care for the ring, of any and everything going above what would be a reasonable difference between the car sample assays and battery assays. It looks as if the public will not have its share of bullion from all ore milled, until the mills are owned or leased by millig companies. Until this time arrives, outsiders had better let mining shares alone for an investment. If they deal in them, let it be only as a gamble, and sell when a good profit is in sight. Take the shares in any leading mine on the Comstock, and they are at a discount after the ring has bought all the shares, and the others are a buy when around fifty cents a share.

It has been many years since the shares in the following mines sold as low as they did this week: Chollar, Potosi, Bullion, Alpha, Exchequer, Challenge, Confidence, Yellow Jacket, Belcher, Overman, Union and Sierra Nevada. In several of the above evidence there is very little to be seen, and the work is being developed either for looting or for showing up, whichever shall pay the best, but in either case the above shares have already been a good buy when they were as low as they are now. The strong depression is done for good reasons, and in time, the shares will sell for more money, how much, each buyer must determine for himself, but "a profit is a profit" and he who does not take it should, as he will, be a heavy loser in the end.

The watch cry should now be "The mines must own or lease the mills." If a mine is to be honestly worked, the directors would favor such a proposition. Another good watch cry is, "Turn all rascals out." The directors of the Hale & Norcross Mining Co. should see that the lawyers who so successfully and fully prosecuted the late suit against the old directors of that company, and the owners of the Nevada Mill and Mining Co., are handsomely paid for their services. Ten per cent or even more of the sum which will be recovered, is not even too small. It was a fight against money, and the long months of getting evidence and litigation attests this fact, and W. T. Baggett and any associate he might have had, should be well paid. This is a duty the directors owe to shareholders in the Hale & Norcross mine. The winning of this suit marks a new era in the history of the Comstock mines, and should result in honest mine management, let the rings fight against it as hard as they may.

M. W. Fox has been granted his application to be

made complaint in the suit against the directors of the Chollar Mining Co.

With the death of W. S. Hohart, the late directors of the Hale & Norcross Mining Co. and the owners of the Nevada Mill & Mining Co., who were defendants in the suit, may find it hard work to get bonds to appeal from the judgment rendered by Judge Hubbard. Each defendant will have to give bonds covering double the sum which he must pay in the event of the other codefendants not being able to pay any part of the judgment. Alvinza Hayward, to appeal, has to give a \$2,000,000 bond. H. M. Levy a \$2,000,000 bond, K. P. Harmon a \$420,000 bond, and so on through the list. Total bonds, about \$10,000,000.

Advices from the Occidental Mining Co. report that the ore which is being milled pulp over \$24 a ton. One hundred tons of ore are to be run through an arrastre, an invention by Superintendent Kinkade. Good results are confidently looked for.

The reported fight for the control of the Savage mine is said to be made by a mill ring, so as to get hold of the 15,000 tons of ore extracted but not milled while the mine was controlled by the Levy-Harmon combination.

H. M. Levy is vice-president of the Seg. Belcher-Midas M. Co.

News from the outside mines is of a very encouraging character. Favorable news from the Comstock mines is hard to get verified. There is no doubt but the work in one or more of the mines is of a most important character, but the mine managers are not prepared to have it leak out, owing to the share market not being in position. If the rings can get the public to buy shares and pay assessments, then no ore will be shown up, but if the public will not buy, then ore will be shown up and dividends, if necessary, be paid. It is the old, old story.

Eastern Metal Markets.

New York, June 9.—The following are the closing prices the past week

	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	40 7-16	88 1/8	4 20	21 70
Friday.....	40 1/8	88 1/8	4 20	21 85
Saturday.....	4 1/8	88 1/8	4 20	21 85
Sunday.....	4 1/8	88 1/8	4 20	21 85
Tuesday.....	4 1/8	88 1/8	4 20	21 85
Wednesday.....	4 1/8	88 1/8	4 20	21 85

Silver to-day easy at 89 cts. Copper is dull, as is lead. Pig tin continues strong. Quicksilver is steady. Borax meets with a good demand. Antimony is slow but steady.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Citations free.

Centrifugal Roller Quartz Mill.

MOTIVE HERCULES
Gas and Gasoline
POWER ENGINES

Have fewer parts, and are therefore less likely to get out of order than any other gas or gasoline engines now built. Just light the burner, turn the wheel, and it runs all day.

MAKES NO SMELL OR DIRT.

No double or false explosions, so frequent with the unreliable spark.

For Simplicity it Beats the World.

It Oils Itself Automatically.

No Batteries or Electric Spark.

It runs with a Cheaper Grade of Gasoline than any other Engine.

FOR DESCRIPTIVE CIRCULARS APPLY TO

PALMER & REY, MANUFACTURERS,
San Francisco, Cal. and Portland, Or.

COLUMBIA, CAL., Dec. 15, 1891.

Messrs. PALMER & REY, San Francisco, Cal.

DEAR SIR: Yours of the 9th to hand. In reply will state that the one-horse power Gasoline Engine I got from you has been running every day, for the past three weeks, and has given entire satisfaction. It is placed in a tunnel full 300 feet from the surface, and is hoisting ore from 100 feet below that. It does all you claimed for it, and is the best and cheapest power that can be had in or about a mine. A number of mining men in this locality have viewed the machine in operation, and they all pronounce it a perfect success.

Yours truly, F. L. McPHERSON.

SAN JACINTO ESTATE, LIMITED,
 Office of General Manager,
 P. O. Address, South Riverside, San Bernardino Co., Cal.
 CAJALCO, Dec. 18, 1891.
 MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
 I am, my Dear Sirs, Yours faithfully,
 S. HARRIS, Manager.

For any information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

 CONSTRUCTION
 AND APPLICATION

THE PELTON
 SYSTEM OF
 POWER

THE PELTON WATER WHEEL.

The most distinctively new and important development relating to hydraulic power that has been made in the last half century. Adapted to all conditions and every variety of service where a head of 20 feet or more can be obtained. OVER 2500 IN USE, AGGREGATING NEARLY 300,000 H. P. Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 to 2000 or more feet. Much better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC POWER TRANSMISSION. The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.
 143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, varying from the fraction of 1 up to 100-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates. The great success that has attended the introduction and operation of the Pelton Water Wheel has led to many imitations and some infringements of the various patents of this company. Intending purchasers are hereby warned that all such infringements will be vigorously prosecuted, and that the users of wheels so infringing, as well as the manufacturers, will be held equally responsible.

THE GATES ORE AND ROCK BREAKER.

Unlimited in Capacity; Unequaled in efficiency. UPWARD OF 8000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without additional expense. Best and only Crusher adapted to Macadam Road Work. Send for Circular.

Buffalo Steam Pumps.

The Buffalo Steam Pump Company of Buffalo, N. Y., have recently designed and introduced certain important improvements in the many forms of steam pumps which they manufacture for all general and special purposes of pumping service; and we here present a cut illustrative of one of their latest designs of compound condensing mining pumps, duplex boiler feed pump and a duplex power-gear pump.

One of the engravings gives a perspective view of the compound condensing mining pump.

Three of this style of pump were recently built for use in the Gogebic and Minnesota iron ranges, and are doing effective work. The high pressure cylinders of the pump illustrated are 12 inches diameter; low pressure cylinders, 22 inches diameter; stroke, 18 inches; and the plungers are seven inches diameter. Their rated capacities are 300 to 350 gallons each per minute, delivered 600 feet above the pumping station, with a steam pressure of 65 pounds in the initial steam chest. The plungers are tied together with steel tie-rods coupled into cast-steel crossheads, and are carried through bronze-lined stuffing box glands. The water passages are one-half (50 per cent) of the plunger area. Each valve chamber contains three valves of a size that also equals one-half (50 per cent) of the plunger area; both the suction and discharge valves are overhead, so that the plungers are always water-packed. The caps of the valve chambers are held by swing bolts. The pumps are supplied through a seven-inch suction pipe, and the discharge is driven through a six-inch column. They are provided with improved single air-pumps and condensers, designed for the most severe duty. The valves of the steam cylinder are of the ordinary plain slide type, and arranged to run by the ordinary duplex movement.

Another pump has been built upon the same plan. The high pressure cylinders are 16 inches in diameter; the low pressure cylinders are 30 inches in diameter; stroke, 18 inches; and diameter of plungers, nine inches. The rated capacity of this pump is 500 gallons per minute, discharged at a height of 500 feet. These pumps are well designed, as represented in the cut; due attention having been given to strength, thereby insuring durability, and as well to simplicity in construction and accessibility of their several parts, thus attaining the desideratum of constantly active service,

with the expenditure of a minimum amount of labor and attendance.

Another cut presents a perspective view of a new design of a duplex boiler feed pump, recently introduced by the above-named company. They are fitted with end suction and discharge pipes, and are built to work against a pressure of 250 pounds. The water cylinders are fitted with remov-

COMPOUND CONDENSING MINING PUMP.

able brass linings. There are seven sizes of this style of pump built by the manufacturers, ranging from $3\frac{1}{2} \times 2 \times 3$ to $7\frac{1}{2} \times 5 \times 8$ inches. All of the parts are made to templates and gauges and are interchangeable, so that any part can be quickly replaced in the event that necessity requires such replacement.

Another design presents a recently improved form of a power-gear pump. These power pumps are double-acting and

BUFFALO DUPLEX POWER GEARED PUMP.

provided with patent removable water barrels; have heavy crank shaft, connecting rods, crossheads, gears, etc. The bearings and slides are arranged for taking up wear. They are built with great care from careful designs, and are well adapted for the heavy work of a power pump. This style of pump should be run at a much slower speed than steam pumps, as all shocks given to the propelling power are transmitted directly to the pump; in a steam pump the steam pressure is elastic, which gives an entirely different action to the pump. The power pumps can be geared direct to the jack shaft of turbine water wheels, or driven by gear connection from a line shaft, or can be driven by belt. They are furnished of any capacities up to 5,000,000 gallons per day.

The agency for the sale in the Pacific States of the above-described pumps, as well as other special forms built by the Buffalo Steam Pump Co., is under the direct management of the Joshua Hendy Machine Works, No. 51 Fremont St., San Francisco.

PROF. T. S. C. LOWE, of Pasadena, has been appointed one of the Yosemite Com-

missioners by the Governor. Professor Lowe is one of the best-known men in the southern part of the State. He is remarkably progressive, and has done more to push the interests of the San Gabriel valley than any other one man. He is now building an electric railroad up Mount Wilson. Professor Lowe is a scientist of national reputation. He is the inventor of the system of water gas that has made such a radical change in the use of light and heat.

Professor Lowe is one of the wealthiest men in Southern California, is president of the Citizens' Bank of Los Angeles, and has one of the most palatial homes in the State, in Pasadena.

A SPECIAL TRAIN of 11 cars, loaded with 150 tons of refined asphalt from the newly completed refinery at Bakersfield, Kern Co., left on Monday for Sedalia, Mo., where it is to be used for pavements. The train was photographed and so placarded as to show that it is a new California industry whose home is in Kern county.

A STRIKE of gold-bearing ore is announced on Texada island, in the straits of Georgia, about 30 miles from Nanaimo, B. C.

An Amalgamating Device.

Alva M. Stetson, of Oakland, has patented through the MINING AND SCIENTIFIC PRESS Patent Agency an apparatus consisting of a series of superposed shelves or drawers made of amalgamated plates having upturned sides, with perforations made through the amalgamated bottom, and drawers being so arranged that the material falling through the openings will be received upon an amalgamated plate or mercury below, whereby the gold is forced into intimate contact with the mercury by the impact or by its fall. The drawers are placed in such a position that the holes in one drawer will stand above the unperforated part of the surface of the next below it. In the drawers carrying the mercury there are channels for that metal which come under the holes of the tray above. Between these channels are the elevated portions having holes made through them with a considerable imperforate interval between each elevated portion. The drawers containing the free mercury may be alternated with the amalgamated plates.

The metal-bearing pulp, mixed with a sufficient quantity of water, is admitted into the upper part of the apparatus by a sluice. Falling into the upper tray or chamber having a perforated bottom, the pulp is distributed over this bottom and passes through the holes, falling upon the amalgamated surfaces of the drawer next beneath.

These drawers are a sufficient distance apart so that the falling material will gather some momentum and strike the amalgamated plate or mercury trough, as the case may be, with considerable force. This brings any gold or precious metal contained in the pulp in very to intimate contact with the mercury

or amalgamated surface, the gold being, as it were, forced into or against the mercury, by which operation the latter will take up a greater quantity than if the pulp were allowed to pass over amalgamated plates by flowing in the usual manner. The intermediate or ultimate mercury-containing drawers or troughs allow the gold to be entirely submerged when it strikes the mercury. The lighter and more worthless portions of the pulp rise above the level of the ribs in these mercury-containing drawers and flow over them, so as to pass down through the holes which are made through the ribs. In this way the gold will have a tendency to remain in the mercury and not flow off with the lighter particles of the material.

BUFFALO DUPLEX BOILER FEED PUMP.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

Kamloops Mining District.

A Region for Prospectors and Miners.

KAMLOOPS, B. C., June 4, 1892.

TO THE EDITOR:—The discoveries which have lately been made in the valley of the North Thompson demonstrate what has been long believed—that the valley of this river and its tributaries is a most promising mineral region, and one which to the present time remains almost entirely unexplored. The reasons for this belief are that the principal streams forming this river take their rise in the same district as do the waters of the Quesnelle and other large gold-carrying creeks and rivers which have made Fraser River and Cariboo famous for the last 30 years. The waters of the Thompson cut through the slaty rocks which carry the Cariboo gold, and also the limestone and other formations which furnish the argentiferous minerals of the Kootenay districts. Gold has been found in the quartz at Jameson creek, which is about 17 miles from Kamloops, and it also exists on the east bank of the North Thompson near Lewis creek. Quartz rich in silver has been discovered near the junction of the Clearwater river with the North Thompson, about 75 miles from Kamloops. Mineral is known to exist in large quantities at Mahood lake, whose outlet is into the Clearwater. At Tum Tum lake, southeasterly from the upper valley of the North Thompson, very rich argentiferous ore was found many years ago. The sources of this lake reach easterly up to the summit of the Gold Range, on the opposite or eastern side of which is Smith creek, where gold is now successfully mined. Tum Tum lake finds an outlet southerly into Adam's lake, a beautiful sheet of water, on the shores of which fine samples of galena or silver-lead ore have been found. This lake is 50 to 60 miles long and 3 to 5 miles wide, lying east of North Thompson river valley and parallel to its course, some 20 miles distant. It is accessible by trail which follows the course of Lewis creek, and diverges from the wagon-road about 35 miles out from Kamloops. There are no mining locations yet made in this extensive region, which is nearly 200 miles long and about 100 miles broad, reaching to the borders of Cariboo on the north-northwest and to Big Bend on the east, except a few which have been recently taken up, and which are referred to in the report of Mr. H. R. Bellamy, a mining expert, who visited them about three weeks ago. He reports: "My trip up the North river has been of great interest to me, as all new fields of exploration are, especially when they abound in minerals. In relation to these, I wish it understood that I have no desire to overdraw a picture of that district, as I own no interest, and have no axe to grind, and I have long since seen the folly of overestimating mines. I shall describe only what came under my own observation during the trip.

"After leaving the coal camp, to pay a visit to the silver mines 25 miles farther up the river, I was in coal measures for some nine miles, when the granite formations commenced to make their appearance, intermixed with limestone, porphyry, black jasper and quartz leads. I dismounted in several places to inspect them, and could detect silver, lead and copper, and brought down some of the specimens. Arriving at the silver mines, I found no one at home, and could therefore get no information, but found the claims readily. They are three in number, with several tons of ore on the dump. The "Lone Prospector" and the "Ironclad" have had the most work done on them. The mineral in the first named lead showed nearly two feet of clear galena. The vein is three feet three inches, and has a tendency of getting much wider. The mine known as the "Ironclad" is, perhaps, fully as rich. There are several other leads opened, but not much work has been done on them. There are reports of prospects being opened farther up the river, but I did not have time to investigate them."

The following extract is taken from the report of an interview with Mr. Bellamy, in a Vancouver paper: "He found the indications at all of them excellent, and is certain that as soon as facilities are given for getting the rock to the smelter at reasonable outlay, that great profit will be made out of them. Specimens from these mines had been assayed by Mr. Price, the celebrated assayer of San Francisco, and had been found to contain \$50 to the ton.

"Mr. Bellamy said that while these were the only silver ledges being developed, they were by no means the only claims with rich indications. The whole country round about

from these to Kamloops, was rich with silver-bearing quartz, and any number of extremely rich ledges were to be obtained. Besides silver, there were heavy deposits of copper in the country."

In Prof. Selwyn's report of the Geological Survey of Kamloops District for 1891, just issued at Ottawa, he makes the following reference to this section: "It may be mentioned that the numerous discoveries of silver-bearing galena on the North Thompson river at Mosquito Flat, and above the Clearwater, are attracting a good deal of attention. These localities are situated about 50 miles and 75 miles respectively from Kamloops. The ores are said to give rich assays."

These discoveries, in places separated by long distances, all within the well-ascertained mineral belt, give unmistakable indications that there is a great abundance of rich ore lying in and near the region described, which a thorough exploration by energetic and intelligent prospectors would bring to light, not only making fortunes for themselves, but enriching the entire district.

The way to reach this extensive district is by way of the North Thompson from Kamloops. This place is located 250 miles east of Vancouver on the C. P. R., and here can be obtained, at reasonable prices, the needful outfit of provisions and miner's supplies. A good wagon road has been constructed 35 miles out from Kamloops, and trails are used from that point. The weather is favorable in this district, there being very little rain to interfere with prospecting. The climate is healthy, and the season is nearly two months longer than it is farther east in the Selkirk and Rocky mountains. There is no unexplored section of British Columbia so easy of access, where prospecting can be prosecuted with such assurance of favorable results as in this one.

About 50 miles from Kamloops, on the river, coal of good quality has been found, and a company has been formed, which is now developing one of the locations with good and improving prospects. The seams of coal are within a short distance of the silver mines already discovered, and possess coking qualities which will be invaluable for smelting the ores.

The North Thompson is navigable for 120 miles for large steamers. In addition to this, and more important still, is the interest which certain leading men of the Canadian Pacific railway, and other capitalists, are taking in the quartz mines at Mosquito Flats, as well as the coal mines, and is a sure indication that a branch railway will be built up the North Thompson from Kamloops.

Within a few miles of Kamloops, there is an inexhaustible supply of magnetic iron ore, which has been pronounced by the smelters of the Pacific coast to be invaluable for smelting purposes.

The location of Kamloops at the confluence of the North and South Thompson rivers, furnishing nearly 400 miles of lake and river navigation; with its iron mine, its coal mines, its control of timber resources; making the safe foundation for the establishment of iron furnaces, and smelters for the reduction of ores, and the manufacture of lumber and furniture, in addition to its unexcelled climate—besides being the place whence will start the Kamloops, Cariboo and Alaska railway up the valley of the North Thompson, should and doubtless will attract the attention of capitalists, and make Kamloops the active and prosperous city of the interior which its natural position and advantages entitle it to become.

Mining in Montana.

Joseph Hogan, State Mining Inspector, is in the city. Speaking of the industry of mining throughout the State, he finds that while there are probably as many, if not more, men actually engaged in mining, the amount of prospecting and development work going on is not as great as this time a year ago. The operation of the Anaconda properties keeps the number of men at work in mining about the same as that of a year ago. He finds that the big companies are not doing the amount of "dead" work that is usually going on, but they are taking out just enough ore to keep the properties running. The hills, which a year ago were alive with prospectors, are almost deserted now. All this inactivity he attributes to the low price of silver. It discourages the prospector and leaser, who are not particularly zealous about devoting all their energies for the benefit of the owners of reduction works.

"How is the coal mining industry progressing in Montana?" asked the reporter. "It is ever on the increase. There are about 1500 miners engaged in coal mining at present, divided as follows: Rocky Fork, 400 men; Sand Coulee, 450; Horr Coal and

Coke Co., 300; Cokedale, 200; Timberline, 150; Belt mines, 50. Besides these, small forces are at work in the new coal discoveries of the Flathead and Milk river valleys. Outside of those I have mentioned, there are probably 100 men at work on other coal and coke properties. But 1500 men is a pretty reliable estimate of the whole number.

"I expect to see fully 2000 men at work in coal mines before the year is out. The Anaconda Company, which is reported to have become interested in the Belt coal fields, will, no doubt, work its property on a scale similar to that with which it undertakes every enterprise.—Inter-Mountain.

Reno Reduction Works.

We are informed from a reliable source that the reduction works will hang up its stamps this evening.

The business of milling ores on the Truckee river will cease, at least for a few weeks, but it is expected that arrangements will be perfected in a short time so that business will be resumed. Mr. Beck informs us that Mr. Farrington has met with so many reverses in mining operations during the last four years that he is to-day without capital to prosecute his mining and milling operations any further. The reduction works, which were rebuilt by Mr. Beck for Mr. Farrington during the last six months, were yesterday turned over to Mr. Beck as his sole property in payment for advances made in rebuilding and otherwise. In a few days Mr. Farrington will leave Reno for the southern mining country to start anew, and we are proud to say that the best wishes of every one who knows Archie Farrington will go with him, for he is certainly one who has fought nobly for the best interests of Nevada, and, unlike others who made fortunes in our State, he spent his last dollar in fighting in favor of our principal industry—silver mining.

The low price of silver and the high rates of freight on ores have been almost the direct cause of the financial failure of Mr. Farrington.

Mr. Beck thinks he will in a few weeks be in shape to start the works again, and believes that if the railways will make a concession in favor of lower rates on low-grade ores, that the enterprise of milling on the Truckee can be made a permanent industry.

FARRINGTON'S MISTAKE.

The above is from the *Reno Journal*. All of Esmeralda's people sympathize with Mr. Farrington, but at the same time we cannot help regretting that Mr. Farrington should have taken the money he made in the mines of this county and dropped it into the Truckee river through the reduction works. If he had erected a smelter at Cat Creek, near Walker Lake, he would have realized a handsome return. The freight rates would have been small, and owners of promising low-grade mines would have been encouraged to prospect, knowing that they could have their ore worked cheaply at home. Lead-silver ledges are plentiful in this county, but the cost of shipping and smelting is enormous, and nothing but high-grade ores can be handled. With a smelter at Cat Creek, a large number of men would be working night and day to furnish it with ore.—Walker Lake Bulletin.

Arizona Copper.

The Arizona *Silver Belt* says:

The product of the Old Dominion Copper Co. in May, with three furnaces in blast most of the time, was 1,014,000 pounds of copper, by far the largest output in one month ever made by the company. A little more than 6,000 tons of burden (ore and flux) was put through the furnaces. Consequently the product was only 8.4-10 per cent of the burden.

The significance of this showing lies in the demonstrated efficiency of the plant and ability of the company to work successfully, ores averaging as low as 8 per cent in copper. It shows conclusively that the Old Dominion Copper Co. can compete with any mine in the production of copper.

The company's mines, which it was predicted years ago would soon play out, appear now to be only in the infancy of productiveness. Much new ground has been recently opened in the Alice claim, where two winzes are being sunk from the tunnel, one in ore and the other showing strong indications of it. Notwithstanding the heavy draft upon the ore bodies during the past month, the supply of ore is now larger than ever, and constantly increasing.

The output of copper is limited only by the capacity of the plant and the will of the company.

Coal at Nanaimo, B. C.

The city of Nanaimo and suburbs, with the 6000 or 7000 inhabitants, owes its prosperity and its very existence to the New Vancouver Coal-Mining & Land Co., which, in 1862, bought and obtained a transfer from the Hudson's Bay Co. of the valuable Nanaimo estate, with the collieries, its town and other buildings, sawmill and shipping wharves, including all the dominant shore and other rights and privileges, held by the Hudson's Bay Co. by virtue of its special charter and grant from the crown. The mines and works of the New Vancouver Coal-Mining & Land Co. form the main resources of the town, and the great bulk of its inhabitants are directly or indirectly dependent upon the success of the coal industry, which is promoted so energetically by the company. For several years after the commencement of its career the company was struggling against many difficulties. Natural "faults" in the subterranean strata and other causes, together effected discouraging results, so that the total output between 1862 and 1883 only ranged from 20,000 to 90,000 tons of coal per annum, the highest figure being reached in 1883. In 1884, by more energetic management, the output of coal rose to 103,000 tons and steadily increased until a production of coal from the mines of the New Vancouver Coal-Mining & Land Co. amounting in round numbers to 500,000 tons per annum has been achieved, with a most promising outlook for a further increase in the demand for the famous Nanaimo, Southfield and New Wellington coal, mined by this company only. Of the immense output about 400,000 tons were exported and about 60,000 were distributed in local sales, and the remainder put for consumption in the furnaces of the 30 or more engines of the company itself, which use an average quantity of 100 tons a day. To meet the great extension of the company's business the capital of the company was augmented, but by no means correspondingly with the expansion of the concern.

The company has at present five mines open and four in active operation—all commenced since 1874. They run down to great depths, and have double shafts (or pits) for ventilating, the law not allowing more than a limited number of men to work in a mine with but one shaft. The gross output from these mines has aggregated 2000 tons a day.—Coal Trade Journal.

A Code of Mine Signals.

State Senator E. C. Voorheis is corresponding with the different mining engineers of the State with a view of introducing in the next legislature a bill for the enforcement of a uniform system of signals in all the mines of the State. At the present time the code of signals are so at variance in different mines that a man going from one to the other is utterly at a loss to understand them; and that there are not more accidents in consequence is due more to luck than anything else.

We print below for the benefit of all concerned, the code of signals now in use by the two thousand and odd mines of the State of Colorado. The *Record* asks that all the papers of the State will help along this much needed improvement in mine management. Any letters of inquiry addressed to this office or to Hon. E. C. Voorheis, Sutter Creek, Amador county, California, will be promptly answered.

- 1 bell—To hoist. (See rule 2.)
- 1 bell—Stop if in motion.
- 2 bells—Lower. (See rule 2.)
- 1-1-1 bells—Man to be hoisted. Run slow. (See rule 3.)
- 4 bells—Stop and start pump.
- 1 3 "—Stop and start air compressor.
- 5 "—Send down tools. (See rule 4.)
- 6 "—Send down timbers. (See rule 4.)
- 7 bells—Accident. Move hucket or cage only by verbal orders.
- 1-4 bells—Foreman wanted.
- 2-1 1 bells—Done hoisting until called.
- 2-1-2 "—Done hoisting for the day.
- 2-2-2 "—Change buckets. From ore to water or vice versa.
- 3-2-1 bells—Ready to shoot in the shaft. (See rule 3.)

Engineer's Signal. That he is ready to hoist is to raise the bucket or cage two feet and lower again. (See rule 3.)

Rule 1. In giving signals make strokes on bell at regular intervals. The bar (—) must take the same time as for one stroke of the bell and no more. If timber, tools, the foreman, bucket or cage are wanted to stop at any level in the mine, signal by number of strokes on the bell, the number of the

level first, before giving signal for timber, tools, etc. Time between signals to be double bars —. Proposition: 6 — 5 bells would mean stop at 6th level (with tools); 4 — 1-1-1 — 1 would mean stop at 4th level, (man on), (hoist); 2 — 1-4 would mean stop at second level (with foreman).

2. No person must get on or off the bucket or cage while in motion. When men are to be hoisted, give signal for men. Men must then get on bucket or cage, then give signal to hoist. Bell cord must be in reach of man on the bucket at stations.

3. After signal "ready to shoot in shaft" engineer must give his signal when he is ready to hoist. Miners must then give signal of "men to be hoisted." Then "split fuse," get into the bucket and give signal to hoist.

4. All timbers, tools, etc., "longer than the depth of the bucket," to be hoisted or lowered must be securely lashed to the cable. Miners must know they will ride up or down the shaft without catching on rocks or timbers and be thrown out.

5. The foreman will see that one printed sheet of these signals and rules for each level and one for the engine room are attached to a board 12 inches wide by 36 inches long and securely fasten the board up where signals can be easily read at the places above stated.

A Revival in Mining.

Dwellers in Colorado for the past 20 years unite in the opinion that the prospects for the mining industry were never better than they were to-day, says the *Denver Sun*, and there has never been a time in the history of Colorado when the new districts opened up gave stronger evidences of continued prosperity.

Mining camps of a permanent character are not often developed in a month, or even a year. It was two years after the first discovery of the value of carbonates before Leadville became what it has since remained, and when B. Clark Wheeler came to Leadville to sell town lots in his new town of Roaring Forks, just across the river from the present towns of Aspen, and predicted that the mines of that district would rival Leadville, he was considered visionary. That was in 1890, and though the men who pinned their faith to Aspen continued to delve and open up the deposits which underlie that wonderful camp, it was five years before the camp began to show any indications of the great mining center that it has since become.

Twenty years ago the treatment of ores containing refractory elements in an economical manner, was not generally understood, and as a result, many districts known to be rich in the precious metals were left undeveloped; even where there was a minimum of the refractory minerals time was necessary to reduce the system of mining and reduction to a profitable basis. This has been greatly changed, and while much has to be learned and new discoveries are continually being made in the matter of the reduction of ores, there must be an unusual amount of stubborn qualities in an ore to cause its rejection at the smelter. The result is that a greater proportion of the ore found is merchantable. That of itself is a stimulus to the mining industry, causing the working of veins long since abandoned, the product of which assures a moderate profit.

The changed conditions affect the new camps by shortening the time of probation which they must necessarily undergo. But development work must still be done. A discovery is not a mine, for there are few prospects in which the discovery shaft opens an ore body sufficiently large to pay from the start. Development alone makes a mine, and while prospects are sometimes sold for handsome figures, large investors look for more than a mere chance, for as the miner has it "one man can look as far into the ground as another."

The fact, therefore, of such large sales as have been made at Creede, at Cripple Creek and at Copper Rock camps of only a few months existence, in which the development is necessarily of the most primitive character, is a strong indication that the season of 1892 is one that will witness a revival of the mining interests such as has not been witnessed since the boom days of Leadville passed into history and that camp settled down to the position of one of the greatest steady producers in the world. Mining property is always sought for when backed with something tangible, and it is evident that the new camps have backing of no trifling character.

TEAS.—Recent investigation has shown that the amount of tannin, which is the noxious element in tea, is from three to five times as great in Bengal and Ceylon leaf as in the Chinese.

Works at Anaconda.

Anaconda is one of the wonders of Montana, and of the world; and yet how many Montanians not actively engaged in mining or the reduction business know anything about it? Not one in a thousand. A representative of the *Montana Mining Review* has been permitted to inspect these marvelous works, and will endeavor to give a plain and brief account of what he saw there.

The situation of Anaconda is decidedly pleasant and attractive. Nestled in a snug corner of the Deer Lodge valley, it has a tall and massive mountain in its rear, covered with perpetual snow, while a lower range of grass-covered hills, reminding one of those of Switzerland, comes down to the valley's edge, giving form and color to a scene that is filled with surprises for the observer. The neat passenger station is near the heart of the town and only a short walk from the Montana hotel, the largest and finest in the State. It has not the beautiful surroundings of the Broadwater, but is a city hotel of simple brick and mortar, in every way suitable for a city of 100,000 inhabitants, and altogether wonderful in a town of 6,000, most of whom are laboring men baving their own homes.

On the right as you enter the town, you see the great reduction works of the Anaconda Company, extending for upward of two miles along the hillside; and on the crest of the ridge above them rise the huge brick chimneys which carry off the smoke and fumes from the smelters and other works. Two immense flumes run along the hillside, one on the lower, the other on the upper level, to supply every branch of the colossal plant with the cleansing liquid. Water plays an important part, as we shall see, in all its processes, and it is provided and distributed in a very skillful way.

A visit to the works can only be made by permit, and regular sentries must be passed at all salient points. The upper or old works consist of a large concentrator and smelters Nos. 1 and 2, the lower or new works of the largest and most complete smelter and concentrator in America. About 1800 men are now on the payrolls at these works, and all are as busy as bees, one-half working by day and the others by night. Besides these sections of the plant, the electrolytic refining process, occupying three large buildings, is now in operation, as also a large battery of Bessemer converters, which are taking some fortunes out of the slag thrown away by former imperfect systems. With the process now in use, there is no object in keeping the slag for further treatment; therefore, when it is drawn off from the furnaces, it is run into a jet of water driven at high pressure, which granulates the slag and carries it far away through the waste sluices in the form of coarse sand or dust flakes. This is an immense saving of time and labor, it being estimated that at least 200 more men would be needed to remove this slag. The system was introduced by Mr. Stalmann, one of Mr. Daly's right-hand men.

For the benefit of the lay reader, a brief account is given of the process from the ore to the mercantile commodity.

When it comes from the mine, most of the Anaconda ore is a grayish-looking rock, much of it having the mixed metal running in streaks through it. The trains of the Montana Union are now taking down about 4000 tons a day. The works are approached by tracks along the hillside for the upper and lower levels, and the ore is delivered into the bins of the concentrators on the upper line. These bins have a storage capacity of 78,000 tons, so that sufficient may always be on hand for several days' work. From the bins the ore passes through the concentrator, which begins by crushing it, and then, by various washing devices, carries away the nonmetal portions, reducing the bulk so that only the mineral goes back to the smelter. From stage to stage, by gravity, the concentrates descend until they are finally carried off by a force of water into the settling rooms. Here the water is automatically drained off, and the concentrates, in the form of fine sand, are hauled back to the smelter on top of the hill to have the metals melted out of them. This hauling is done over a trestlework tramway with a regular hoisting engine. The cars are wheeled on iron tracks and emptied first into huge revolving iron cylinders, which destroy a greater part of the sulphur. Then the red-hot mass is discharged into the furnace, where it is reduced to liquid and drawn off into molds. The metal so drawn is known as matte, and contains not only the precious metals, but a percentage of iron and other base metals. It has been the custom to ship it in this shape to Wales, Germany and elsewhere for separation and

refinement, but Mr. Daly lately became convinced that all this could be successfully done in Anaconda, and the sequel shows that he was right.

He is at present producing in his electrolytic works the copper in pure ingots and saving the silver and gold from the matte. It is now simply a question of time and policy whether the more extensive works for this process shall be erected in Anaconda or at some other point. Built they are sure to be, and that, probably, within another year.

With a payroll of over \$140,000 a year, and the expense of 400 tons of coal and 180 cords of wood each 24 hours, it is readily understood what an enormous product there must be even if no account were taken of the millions invested in the plant. It is estimated that the electrolytic works, when completed, will employ about as many men as are now working in the present plant, so that there is a probability of Anaconda being about doubled in population within a year or two.

To say that Anaconda is worth seeing would be a mere commonplace. The *Review* goes further and says that every Montanian who fails to see it is recreant to his duty as a patriotic citizen. The railroad trip is an easy and comfortable one; the hotel is all that any one can desire. There are electric cars to all points at 5 cents fare. The town is splendidly lighted with electricity, sewerage throughout, and has a plentiful supply of pure mountain spring water. No one can form an intelligent notion of the great mining industry of Montana until he has visited Anaconda.

Something should be said about the model cottages and many other things that have been produced there by the ruling genius of Marcus Daly, but space makes it necessary to put this off till another issue. From start to finish throughout the works it is plain that an intelligent class of labor is employed, and wherever one goes he hears nothing but praise and words of affection for the man who, with his able lieutenants, has brought this world of wonders out of nothing.

The poor Irish boy who landed as an emigrant, and worked on the docks of New York, at the age of 55 is a millionaire; but he is more than that. Throughout his career in building up the Anaconda works, he has been a human benefactor, winning the confidence, esteem and affection of all who know him through little deeds of kindness that have been as secret as they were timely. Mr. Daly has a great faculty for choosing the right men for assistants, and his success is due almost as much to this fact as to his own great initiative genius and enterprise. He is liberal, generous and genial to everybody, and it is safe to say that no man in Montana is more beloved by his employees than Marcus Daly.

The Big Telescope.

The Second Glass for It Arrives from Paris — The Photographic Instrument.

News reaches Mr. Raymond from Boston that the second lens for the great 40-inch glass contracted for by the University of Southern California has been received by the Clarkes from M. Mantois, the Paris manufacturer. It is known to our readers that the university project involves the erection on Mt. Wilson of the largest visual telescope in the world, and that Alvan Clarke & Sons, of Cambridge, were awarded the contract to finish the two lenses necessary for it, which are each 40 inches in diameter—four inches larger than the Lick Observatory glass. The contract for casting these great lenses was given to M. Mantois, the only man in the world, probably, capable of doing the work. The first lens was completed about two years ago, and has been in the hands of the Clarkes ever since. After repeated failures, the second lens has just been turned out and received at Cambridge, as stated. Each cost \$8000. They are to be finished by Clarke & Sons, but when that part of the contract will be carried out is very uncertain, as the money for it is not forthcoming. The finances of the University of Southern California are not in condition to stand any further expense, and the whole project will necessarily be in abeyance until some rich individual endows the astronomical department of the institution. The construction of a 24 inch photographic telescope and its erection on Mt. Wilson is a distinct enterprise, as is generally known. That is under the auspices of Harvard College, of Cambridge, and the money for it has been provided in advance by a wealthy New York lady. The Clarkes also have this instrument in hand and are hard at work upon it. When completed, it will be the

largest photographic telescope ever constructed.

From information lately received, it seems increasingly probable that the observatory for it will be put on Mt. Wilson, as contemplated. President Eliot's recent visit to the site is thought to have virtually settled the location, but, of course, nothing official on the subject has yet been announced.—Pasadena Star.

COKING COALS OF WASHINGTON.—Gen.

A. Dehune, State Geologist of Washington, in his second annual report, gives a lengthy description of the coals of Washington, comprising lignites, semibituminous and bituminous coals. The lignites extend from the county of Whatcom on the north, through King, Pierce, Thurston, Cowlitz and Chelan counties to the southward. Eighteen workable seams have been uncovered. The extent of the lignite vein is estimated at 650,000 acres. Twelve mines are now in active operation in this district.

The bituminous and semibituminous measures of the basin are found below and east of the lignites. These bituminous measures extend from Lake Whatcom on the north to Lewis county on the south. Seams of coal adapted to the manufacture of coke are found in Skagit, King, Pierce and Whatcom counties, in Western Washington, and in Kittitas county, in the eastern part of the State.

The coking operations are enumerated as follows: The Fairhaven mines of the Skagit Coal and Transportation Company, Whatcom county; 8 measures, 4 workable; thickness of seams, 9 feet, 12 feet, 9 inches, 18½ feet, 21 1-12 feet and 23 feet. All are cut by a 1200-foot tunnel. The company is erecting coke ovens.

The Connor-Cumberland mines are located near Hamilton, Skagit county. Six seams have been developed, measuring 3 feet, 4 feet, 5½ feet, 3½ feet, 3 feet and 3 feet 4 inches. The coal is friable and cokes well. The Snoqualmie Coal and Coking Company is working 6 seams of coal on the Snoqualmie river, 7 miles from Snoqualmie Falls. The width of the coking seam is 7 feet 6 inches. The Wilkeson Group is the name given 9 seams of coking coal being mined in the south end of the Puget Sound basin, in the southeastern part of Pierce county. The Wilkeson Coal and Coke Company has a of ovens in plant operation.

THE EUREKA MINE TESTED.—These

are lively times at the Eureka mine, near Hornitos. The last carload of machinery recently went up from Merced, and a preliminary run has already been made by the mill. The results were highly satisfactory; the more so, as the rock crushed was from the 100-foot level, where the grade is much below that of the ores found at a greater depth. The experiment has proven the success of the venture beyond all question, and in view of the values secured in amalgam and concentrates, it is a wonder this remarkable mine has escaped the attention of capitalists so long. The Eureka is a true fissure in slate. The vein is very large, running from 5 to 20 feet in width, carrying gold, silver, sulphurets, etc., and is opened to a depth of 200 feet by a shaft, and levels driven therefrom. Besides this there is a mountain of ore behind and above the mill, well opened by tunnels and which a 30-stamp mill could not exhaust in years. So the amount of ore practically in sight is phenomenal. It is the intention of Dr. Callahan and his associates to run the mill by electric power from the Merced river at no remote day, and when this is done it will be possible to work cheaply and profitably not only the Eureka, but all other good mines in the vicinity of Hornitos and Quartz mountain.—Merced County Sun.

USE OF GRAPHITE.—Referring to the

use of graphite, a correspondent in a contemporary says: "In making pipe cement, or as I would term it, pipe smear, it is not necessary to use the best oil or grease, as it is the graphite, and not the body in which it is suspended, that makes the mixture valuable and the joint perfect. I use the drippings from line shaft bearings, caught in the ordinary way and mix them with the best Ticonderoga flake graphite so that the compound can be applied with an ordinary sash tool. During the past three years I have used about 15 or 20 pounds of dry flake graphite for pipe joints, cylinder heads, piston rod packing, etc. Bolts smeared with graphite mixed as above, I have unscrewed after having been in the dampest places for upward of two years, or more, proving the anti-rusting qualities of graphite. To cool hot bearings put it on as thick as it will mix with oil."

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

ZEILE.—*Ledger*, June 11: The air shaft has been repaired sufficiently to enable the miners to go to work again. A large number of the men returned to work Monday, and others a day or two afterward. The mill was started on Wednesday, so that this great mine—the mainstay of Jackson—is again in full working shape.

BAY STATE.—This mine continues to look encouraging. The ore body encountered last week at a distance of between 50 and 60 feet from the shaft, proved to be a boulder ledge.

HARDENBURGH.—A small force is working at present in this mine, for the reason that the company is preparing to make a payment for the property according to the terms of the bond. There is little doubt that the bond will be redeemed.

PIONEER CREEK.—*Amador Record*, June 9: Owing to the late rains, the mining interests in this section have been quite dull, as it was next thing to an impossibility to get the ore from the several mines to the mills. But now that the weather has somewhat settled, things begin to assume a business-like look. At the Brooks-Griesback mine, they are running a new tunnel to tap the mine deeper than it has ever been worked before. This mine has been worked for years, and the owners have every confidence of reaping a handsome reward, as soon as they strike the main ledge. They have a good five-stamp mill. Mr. Geary is going to reopen the Old French mine. South of the Old French mine is the Lester-Kimball. This mine is worked through a shaft to the depth of about 170 feet. The ledge will average about 18 inches in width, but is rather pinched in the last few feet. They have about 70 tons of ore on the dump. This ore is somewhat refractory, and the owners think of sending it to San Francisco or Colorado for reduction. Noah Bowman has about 30 tons of fine-looking ore, and his prospect looks flattering. The old Modoc mine is still idle. East from here is the Stirman-James mine—at present the chief of the district. This mine is worked through a shaft to the depth of about 70 feet. The ledge averages about 20 inches in width. They have at present about 30 tons of high-grade ore on the dump. They, as well as others, claim that they are extracting richer ore at present than has ever been taken from the mine heretofore. If that be true, it is good enough, as their last crushing paid a little over \$127 per ton. They have a fine, first-class, five-stamp mill near the mine. South from here is the "Roaring Water Spout of the Rocky Mountains," owned by Len Harmon and Charles Stirman. At present they are milling their ore. Billy Scott is reopening the North Star.

CRUSHING.—Parties who have been cleaning up the old dump at the New London mine, near Plymouth, had a crushing at the Reeves mill, and last week were rewarded with a gold brick containing \$1082 as a result of their labor. The New London mine was closed down last fall and the machinery moved away, after the expenditure of a large sum by the company, who failed to develop anything satisfactory.

AN IMPROVEMENT.—At the Hector mine, arrangements are being perfected to put in an electric light plant. Knight & Co. are to furnish the dynamo.

Butte.

NEW QUARTZ MILLS.—*Oroville Register*, June 9: From Surveyor B. L. McCoy we gather the following mining items: Mr. McCoy has been up in the hills for some weeks past surveying mining claims, running lines, etc. There are 24 or 25 men at work at the Rainbow mine at Yankee Hill. This is the old Wellington mine, now owned by Capt. Griffith of San Francisco. He and W. T. Coleman will run a ditch, four miles long, from near Sawmill peak to their mines, and use a portion of the water from the Cherokee ditch to run their new mills. A 15-stamp quartz mill will be erected on the Rainbow and another on Mr. Coleman's property, which adjoins this mine on the north. Each mill will be of the same capacity, and there will be an abundance of power for running both mills. Mr. Coleman has lately bonded the Porter ledge and will open the 700-foot tunnel and develop the mine. This is believed to be a rich lode and one that is extensive. On the Rainbow the shaft is down 125 feet and new and improved machinery is being put in for working the ore. The vein is about two and a half feet wide, and as the shaft is sunk deeper the vein grows both wider and richer. Mr. Coleman, on the Christie ledge, has a shaft down 100 feet and the bed of ore shows up well. Yankee Hill promises to be one of the best mining camps in Butte during the present year. At Nimshe's the Butte Belle Co. will run a new level to tap the Indian Spring channel, and the owners believe they have a bonanza. Near Centerville there are 12 Chinese companies working mining land that has been almost constantly worked for 42 years, and yet they get fair returns for their labor.

THE GRAVEL RANGE.—*Cor. Oroville Register*, June 9: Quite a decided stir among mines and mining men is reported from the Gravel Range country. Messrs. Huff and Bunnell opened a small quartz ledge about two years ago in this section, and with untiring perseverance worked it single-handed and alone. Soon it began to yield small but well-filled pockets, a few of which were emptied greatly to the advantage of the provision store in that section. This mine is located near the Butte King, and has recently been purchased by Messrs. Heckart and Parrish, who are putting the property in shape for extensive work during the summer months. Negotiations are already closed for

suitable machinery, which will be run entirely by water power. In the vicinity of the Huff and Bunnell lies the D. K. Perkins mine. The owner, I am told, sets much store by this ledge. It was opened up by Dave Reese, a miner of luck and experience, and purchased by Perkins of Oroville, who has gone at it in a business fashion, as we should expect he would do. The best applications in machinery are placed here regardless of expense, establishing the fact that Butte county quartz property is rapidly rising in the estimation of wise and experienced mining men. There is no question regarding the future mining attractions in this particular section. The Carr mine is again in running order and paying its owner, as it always has, fine dividends. This property is well known both at home and abroad. J. M. De Long is also reported to have struck rich gravel. He believes he has the outlet of the Butte King, being situated about a mile below. Hope he has. Still farther below, a party, headed by Sam Melim of Chico, have another fine prospect. They went into camp at this point with a fine outfit and plenty of good nerve. The John Hupp mine shows fine prospects. Messrs. Boyd & Co. have opened up between the John Hupp and Mineral Springs in a decidedly shipshape way. I have forgotten the name given to the newly developed, but name or no name, it is no doubt a good thing. At Nimshe's, the Blackleg, the Index and the Billy Morgan, as it is usually called, are doing well. Below this point, in the Big Butte, Messrs. Nichols & Co. are piping, with the best of results.

Humboldt.

THE OIL WELL.—*Western Watchman*, June 4: Good reports come from the oil well at East Branch. Letters coming in from Supt. Gillilan to Secretary O'Neil bring the intelligence that on Saturday the well was down 565 feet. At the depth of 545 feet a hard stratum of rock, which dulled the drills rapidly, was encountered and still continues. This is said to be a favorable indication and was expected by Mr. Gillilan. He writes that he feels sure that this rock is the casing, and when the drill shall have gone through it, either salt water, oil or gas will be struck. This company holds 11,520 acres of oil lands. Should the section prove rich in oil, as the surface indications guarantee, there may be 20 flowing wells opened on a single claim, and still the company has left over 11,000 acres for the opening of more wells. As we have said, who can tell where the limit of appreciating value may be? Nearly all the land held by the company is as favorably located as where the well is now being sunk. Should this land prove to be located on the rich part of the oil belt, the limit of development or appreciating value can scarcely be named.

Modoc.

HAYDEN HILL.—*Cor. Adin Argus*, June 4: It has always been my earnest desire to see a tunnel through the Hill, and to determine the correctness of my belief I got two or three companies formed, at different times, with capital stock of \$50,000 each. Disputes of various kinds arose after locations were made, which caused them to abandon the enterprise. Still persisting in my efforts, I gave my views to some local capitalists—men of enterprise and judgment—who took a favorable view of the matter and decided in forming the present company, known as the Hayden Hill Tunneling and Mining Co., whose aim is to thoroughly prospect the Hill to a distance of 4500 feet in length and 1500 feet wide, said mines being controlled and consolidated with the tunnel right, thereby allaying all possibility of litigation and at the same time possessing sufficient virgin ground, whose surface croppings have assayed, in gold, \$7 and \$8 in silver to the ton. The history of the Hill is too well known for me to outline its past records; but, it must be admitted, with few exceptions, that the present form of mining on the Hill is very primitive and in many cases a failure, for all the permanent mines of value are buried beneath the lava-capped crust and beyond the individual prospector's means, and rich men decline to invest until something valuable is struck. We have completed 440 feet of tunnel—dimensions 5 by 8 feet, plenty large to admit of machinery when necessarily demanded. We have also cut through several small veins of quartz, pretty rich, but not large enough to prospect. The Brush Hill mine, formerly owned by Mr. Vanherst, has sold one-half interest to Mr. F. Hose, late from the East, an energetic and enterprising gentleman whose unbounded faith in the Hill is unshaken. He intends to locate another tunnel on the south side of the Hill, and also intends to resume work in his old one, being completed about 800 feet. It will materially aid in developing the Brush Hill mine, and also the Evening Star which he intends to purchase soon. Sain, Sherman & Co. are opening up the Evening Star in good shape, and will soon be rolling out the bullion again. The Golden Eagle is leased by Messrs. Dillon, Richie & Pinebrook, and will commence active operations immediately. Everything is looking favorable for a large output of ore this summer.

Napa.

SHIPMENTS OF QUICKSILVER.—*Calistogan*, June 9: During May quicksilver produced at the mines was shipped as follows: Great Western, 603; Napa Consolidated, 415; Bradford, 296; Sulphur Bank, 130; total for month, 1444 flasks.

Nevada.

IMPROVEMENTS AT THE BRUNSWICK.—*Grass Valley Telegraph*, June 9: Major Fitzgerald, superintendent of the Brunswick, is making many improvements. A new ore bin, capable of holding 60 tons of ore, has just been built at the foot of the dump, a tramway 255 feet in length has been laid, and at the mill the rock breakers have been raised 10 feet and an ore platform, with a capacity of from 10 to 20 tons, has been built at the mill. Self-feeders have been placed at the batteries and a contract has

been let to put in two Frue concentrators with improved hells. There is now about 50 tons of good milling ore on hand. Ore is being taken from the east and west drifts. The four-inch pump has been replaced with a six-inch one and the water is readily handled. The mine is looking well throughout and everything is most encouraging.

GROUND-SLICKING.—*Nevada Herald*, June 9: Samuel Barr is working, on a lease, the gravel property of George C. Gaylord and Robert Sharpe, in New York canyon, back of Marsh's mill on Rock creek. This property would make a first-class hydraulic mine. A tunnel is being run, but is not yet into bedrock. During the spring Mr. Barr has been doing a little ground-slicking, with some success. Last week he found a \$40 nugget. Next fall it is proposed to have more extensive development work done.

AT CANADA HILL.—Canada Hill is quite a busy place just now, and there is considerable prospecting going on. Robert Sharpe is taking some fine looking quartz out of the Greenman ledge, and will soon have a crushing. He works through the Gaylord works, using Mr. Gaylord's hoist. A. Nivens continues work on his tunnel which he has now worked for about four years, and hopes to strike something eventually.

IN WASHINGTON DISTRICT.—*Nevada Herald*, June 9: T. S. Ford of this city owns a quartz ledge in the Washington district which is likely to become a valuable property. It is an extension of the German ledge, and is a wide formation. The ore averages about \$8.50 per ton. Mr. Ford is now making arrangements for erecting a mill on the property.

WILL CONSOLIDATE.—Fritz Meister, the well-known mining man of Washington, is now in this city, and is trying to consolidate his claims at Washington with the Canyon Creek, recently purchased by C. D. Haven of Salt Lake City. There are six or eight claims along this Meister ledge, and the Canyon Creek, we are told, is the key to them all. Mr. Meister owns two claims, and if he can effect a consolidation with the others, a company will be organized and incorporated, and the whole property worked on a large scale. It will make a big mine, as there is a mountain of quartz there, some low grade, some high, and it invariably improves in quality as it goes down.

COOLEY'S LUCK.—M. D. Cooley struck it just right when he pinned his faith in the Garman ledge. He recently got his mine opened, and it fully realized all his expectations. News comes from the East that he has just sold a fourth interest in the German for \$25,000.

SALE OF THE SEVEN-THIRTY MINE.—*Grass Valley Union*, June 11: Negotiations have been going on for some time between the owners of the Seven-Thirty mine and the Evening Star Co., and they were satisfactorily concluded on Thursday night. The Evening Star Co. agrees to purchase the property at the price of \$10,000, a payment of \$2000 to be made on the 1st of August; \$3000 on the 1st of January, 1893, and the remainder in 18 months from the date of the first payment. In the meanwhile the Evening Star Co. is to take possession of and work the mine, and pay 20 per cent of the gross proceeds to the Seven-Thirty mine owners, which 20 per cent to be deducted shall be in installments on the purchase price of the mine. Work on the mine is to be resumed with as little delay as possible.

San Bernardino.

CALICO.—*Cor. San Bernardino Courier*, June 9: At this camp several of the best mines have been shut down, pending a satisfactory adjustment of the silver question, and in consequence business is very quiet. The discontinuance of work on the Waterloo system of mines four months ago caused quite an exodus of miners, but of the men who left, nearly all were single, while those with families remained and obtained employment in the mines still being operated. If silver was at par, this camp would to-day afford employment to 1000 men, and sustain a population of 4000. With the price of silver at \$1 per ounce, population would be trebled. The companies now operating are working ore at as low grade as possible, to be reduced at even a very small profit, and thousands of tons, which, were the price of silver to be raised to the old standard, would be good "milling propositions," are rejected, and either dumped with the waste and lost forever, or placed in separate dumps for future use. The Stebbins mill is making a protracted run. There is sufficient ore for a six weeks' run. The Silver King M. & M. Co. is employing about eight men and reducing 160 tons daily. R. H. Greer and Andrew Hance have just made a cleanup of amalgam from the old Hawley mill, where they have been at work for nearly a month. Goodwin and McDonald have a good pay streak in the Young Waterman and are on the road to a fortune. Work is temporarily suspended in the Bismarck. Thos. Gray and Boh Goldberg are making money leasing the Sul mine. Richard Goldworthy has a good showing on the O. K. mine. The Calico Boreate Co. employs about 20 men constantly on its borax properties, and ships sufficient quantity of the product to supply the demand of consumers at the present price, while carefully avoiding an overproduction, lest the market be crowded and a drop in price result.

San Luis Obispo.

A GREAT SILVER MINE.—*San Luis Obispo Tribune*, June 4: The mining excitement in the northern part of the county, recently reported in the *Tribune*, appears to have a pretty solid foundation, as shown from late explorations. Mr. J. L. P. Smith, an old resident of Las Tablas, and a quartz miner of long experience at Grass Valley, has spent some time in prospecting the new discovery, and informs a *Tribune* reporter that the silver-bearing ledge has been traced and located for 20,000 feet along the easterly side of Pine mountain, show-

ing a width of 20 feet. The vein matter is what the miners call rotten quartz, of a yellow color, encased in granitic country rock. Samples of the ore have been sent to San Francisco for assay, and returns have been received showing a value of from \$68 to \$100 per ton, of which about \$11 was in gold. The ore also contains large quantities of sulphurets. The ore, in general appearance, very much resembles that from the Cruikshank mine, a few miles north, which yielded largely a few years ago. Pine mountain was once famous for its quicksilver mines, and now, if silver is so plentiful as reported, a very convenient combination is at hand. We hope the bright anticipations of the miners may be fully realized. John Bagby discovered the mineral character of the ledge, and an expert from San Francisco has examined it, giving his opinion that it is rich as represented. The country far and near has been "taken up," and people by the scores have claimed the earth, or a liberal share of it, most of whom could not tell the difference between quartz and coal, and have "located" at haphazard without reference to any ledge, or at best as to cover "rock." Naturally, not much outcome is to be expected from boring a hole in porphyry on the summit of the Santa Lucia range, but it is certainly the fact that there is a remarkably protuberant ledge, which shows for three or four miles in length and for 20 feet in width, that in one place at least has been proved to contain very rich ore. There would seem to be a strong probability that elsewhere along the ledge such ore could again be found. A number of parties are vigorously at work on their claims at different points along the ledge, and a short time only will be required to demonstrate the facts in the case.

Sonoma.

PROSPECTING.—*Sonoma Tribune*, June 9: The Leopard mine, a few miles west of Healdsburg, is being tunneled at the rate of one foot per day, and the depth already reached is 193 feet. Boring will be continued on for about 20 days, when it is expected that the rich ledge of gold and silver ore will be struck. Isaac Gray, one of the owners of the mine, had the rock of the ledge on the surface of the ground assayed a few days ago, with this result: Total value per ton, \$542.

Siskiyou.

PAYING WELL.—*Yreka Journal*, June 8:—The McConnell & Quinne claim on Klamath river, at mouth of Humbug creek, is paying very well this season, a rich pay streak having been discovered, with prospect of soon striking the old channel, where exceedingly rich pay is usually found. The Supt., A. Smith, has a large force of men at work, and will continue operations day and night, aided by an electric light plant for night shifts, with expectation of realizing a large amount of gold dust this season. Several Oregon companies have staked out claims on Klamath river, all the way from the mouth of Humbug creek to Cottonwood, and are busily engaged in building head and windmills. The prospects are certainly very favorable for excellent reward for the labor and capital expended. Rich pay was realized near Cottonwood in early days, in the celebrated brass wire claim, and Wm. H. Smith took out in the '50s as high as \$10,000 a day from his Klamath river claim at mouth of Rancherie creek, hence we feel confident that the river is full of glittering dust in the old channel from the mining fields of Siskiyou mountain to the Pacific Ocean. All the placer miners in Quartz Valley and at Mugginsville and Oro Fino, are rushing mining operations with the greatest energy, having a good supply of water from the melting snow on Salmon mountains, for working the giants constantly. Morris & Mitchell, who have a rich bank claim at South Fork of Salmon brought to town last week a large sack of gold dust, which they disposed of at express office. They expect to take out a large pile this summer, if not deprived of the water privilege now being contested in Superior Court with Bennett & Co., who also own rich mining ground in same locality.

NEVADA.

Washoe District.

CONS. CAL. AND VIRGINIA.—*Chronicle*, June 11: 1650 level—Have extracted some ore of fair quality in prospecting west from the upraise, 35 feet above the sill floor, which was carried up 59 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. From the north end of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality. From the bottom of the winze sunk 23 feet in this last locality through the old timbers, a north drift has been advanced 33 feet, and a few tons of milling ore extracted therefrom. 1750 level—In east crosscuts No. 1 and No. 3 from the main south drift, in working upward from the sill floor, have continued to extract some milling ore. 1800 level—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract some ore, from the sill floor upward, of milling value. There has been extracted from all parts of the mine during the week 1046 430-2000 tons of ore, which was shipped to the Morgau mill, the average value of which, per car samples, was \$32.24 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was \$26.44 per ton, per battery samples. The ore which remained over at the Eureka mill having been transported to the Vivian mill, there was worked at that mill during the week 174 tons, the average assay value of which, per battery samples, was \$23.51 per ton. Bullion on hand in our assay office, assay value about \$16,200.

OPHR.—1465 level—The drift running south 101 feet below the sill floor of the 1465 level

from the Mexican into the Ophir ground, has been extended during the week 15 feet; total length, 88 feet, passing through quartz and porphyry, with some clay which carried assay values from \$2 to \$6 per ton.

MEXICAN.—On the 1405 level, the drift running north from the crosscut ran east from the bottom of the winze sunk 101 feet below the sill floor of this level, near the south boundary of the mine, at a point 40 feet east from the winze, has been advanced 14 feet; total length, 60 feet, continuing in a porphyry formation showing fine lines of quartz and some clay.

SIERRA NEVADA.—West crosscut No. 1 from the north drift through the Kenosha tunnel, 1000 feet in, has been advanced 30 feet; total distance, 153 feet; face in porphyry.

UNION SHAFT.—The joint Sierra Nevada and Union West drift, 900 level, has been advanced during the week 27 feet. Total distance west of shaft, 2081 feet; face is in porphyry and small streaks of quartz.

ANNES.—On the 420 level, west crosscut No. 2, from north drift on east side of the ledge, advanced 27 feet; formation, clay and quartz.

BEST & BELCHER.—900 level—East crosscut No. 1 has been extended 19 feet through porphyry; total length, 213 feet. West crosscut No. 1 has been advanced 22 feet; total length, 305 feet; face in quartz and porphyry.

GOLD & CURRY.—200 level: North-west drift, 435 feet west of shaft, has been extended 15 feet through hard porphyry; total length, 347 feet. 400 level—At a point in east crosscut No. 1, 85 feet from north-west drift, run north 18 feet in quartz giving low assays. On the Suto tunnel level the joint upraise with the Savage Co. has been carried up a distance of 15 feet; face in porphyry and stringers of quartz; total height, 80 feet.

HALE AND NORCROSS.—On the 800 level have started a new east crosscut at a point 50 feet south of our north line; face in porphyry. Also repairing north drift on this level. On the 900 level are stopping out ore above this level and extracted during the week 139 cars of ore, the quality or grade remaining the same as at last report. Are making some necessary repairs to main north drift on this level. 1000 level: South drift from bottom of 900 winze is advanced 20 feet, making its entire length 55 feet. The face of this drift shows some fair ore. Have started a new west crosscut 30 feet north from bottom of 900 winze and advanced the same 30 feet; face all in quartz, but of no value as yet. 1100 level—Are stopping out ore from north and south stopes above this level, and doing considerable prospecting and repairing. Hoisted from this level during the week 200 cars of ore. 1300 level—We continue stopping out ore north and south from north winze; also opening the new working station at head of incline and retimbering main north drift on this level. Extracted from this level during the week 96 cars of ore. 1640 level—Have repaired and cleaned out the main incline a distance of 20 feet the past week, and have now reached the 1700 level. Have men on repairs in main shaft and other places in the mine. During the week have hoisted 435 cars of ore. Shipped to Brunswick mill 437 1270-2000 tons. Average assay of railroad car samples of ore shipped to Brunswick mill during the week, \$20.36; average battery assay for the week, \$15.17.

COLLAR.—Repairing the north drift on the 550 and 750 levels. The north drift from the station, 930 level, has been repaired for a distance of 500 feet.

POTOSI.—Have started a winze 100 feet north of south winze, 1200 level, which is down eight feet. There are four feet of fair-grade ore in the bottom. The joint Bullion winze is down 363 feet below the 1500 level; bottom in low-grade quartz. Extracted and sent to mill in the past week, 412 500-2000 tons of ore from the 930, 1100, 1150 and 1250 levels. Milled during the week, 373 tons. On hand at mill, 80 1200-2000 tons; average battery assay, \$22.48; average car sample assay, \$23. Sent to Carson Mint 480 pounds of crude bullion.

WARN COMBINATION SHAFT.—The joint Alpha and Exchequer south drift from the north line of Exchequer, 1800 level of Ward shaft, has a total length of 136 feet; face in clay and porphyry. The joint Bullion and Potosi north-west drift, from the 1800 level, has a total length of 490 feet; face in hard porphyry.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level, has a total length of 136 feet; face in clay and porphyry.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of the Exchequer, 1800 level, has a total length of 136 feet; face in clay and porphyry.

OCCIDENTAL.—Have extracted from the 350, 400 and 450 levels 200 tons of ore of the average assay value of \$28.55 per ton. Have stopped the prospect work on the 750 level for the present. Milled during the week 120 tons of ore of the average value as per battery samples of \$24.80. The Zagid drift from the Suto tunnel is in 617 feet.

CON. NEW YORK.—The winze in No. 4 west crosscut, 600 level, is down 7 feet; bottom is in fair-grade ore. We are making repairs on the 800 level.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 800 feet; face in porphyry.

OREGON.

A NEW CAMP.—Bedrock Democrat, June 9: A Democrat reporter met Mr. J. E. Meacham yesterday on his return from the Snow Storm group of mines, about midway between Sparta and Sanger. The company of which Mr. Meacham is the representative is what is known as the Snow Storm Con. G. M. Co., composed of Indiana capitalists. The properties of the company are a group of mines, principal of which are the Snow Storm and Lilly White. Mr. Meacham informed the reporter that he has a

large force of workmen engaged in grading a mill site and getting out timbers for a mill to be erected at once at the Lilly White mine, a location selected on account of its adaptability for water power, the waters of the Eagle canal to be used in the operation of the mill. The machinery for the mill plant will be shipped from this city the first of the week. Mr. Meacham thinks he will be able to get the mill in operation about July 1st. The Snow Storm, which is now undergoing extensive development, is making a splendid showing and will certainly produce handsomely.

VIRTUE MINING DISTRICT.—Messrs. Thomas Hoffman and James O'Neil have commenced their contract of running a tunnel 150 feet in length on the Laura mine, in the Virtue mining district. The Virtue 10 stamp mill is in operation on ore taken from the old dump, much of it prospecting very rich. It is expected that the water in the main shaft will be lowered to the pumps the coming week. At present the water is being taken from the shaft by a tank at the rate of 430 gallons per minute. As soon as the pumps can be started the mine will soon be entirely cleared of water and a large force of miners put to work taking out ore. The White Swan mill is running constantly on very rich ore. The placers of Messrs. Baisley and Mulkey, and Borman & Co., are running night and day with a fair head of water. The Hawkeye, owned by Cochran & Co., is producing a good quantity of ore. A tunnel is in 20 feet.

WASHINGTON.

A MOUNTAIN OF ORE.—Okanogan Outlook, June 3: About three months ago, Robt. Allison located a claim on a large quartz dyke in what is known as the Shaker Bend of the Similkameen river and began experimenting with the rock. These experiments were satisfactory, and proved that the whole dyke would pay well to work. He then associated himself with several other gentlemen, and together they located 16 claims, covering the entire cropping of the dyke, which is nearly three-quarters of a mile square. Figuratively speaking, it is a mountain of ore. Some 75 assays have already been made of cropping from different parts of the mountain, with results averaging from \$3 to \$8 per ton. These results were kept secret until about a week ago, when the men who were at work prospecting the property stumbled upon what promises to be one of the richest ore chutes ever encountered in the United States. They had found some rich cropping and begun to sink on it, and had hardly removed the grass when they commenced to take out honey-combed quartz literally full of free gold. News of the strike spread like wild fire, and, in less than 48 hours, nearly every foot of ground for four miles around the claim was staked off by excited prospectors, who flocked in by the hundreds from every section of the country. People have visited the mine by the hundreds during the past week, and every one pronounced it the most wonderful showing they have ever seen. At the time the writer visited the mine, three days ago, they had uncovered the chute for a space of about 44 feet wide by 10 feet long and four feet deep, and nearly every piece of rock taken out shows more or less free gold. It is located just below the Falls of the Similkameen, and extends right down to the water's edge. The locations extend 4200 feet along the river front and 45 feet back into the mountains, and much of the ground can be traveled over with a wagon. Prospectors have known of this dyke for the last 20 years, but considered it worthless.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

HAND-SETTING MECHANISM FOR TIME PIECES.—Arnold Bradley, Cherryvale, Kansas, assignor of one-half to W. P. Hammon, Oakland, Cal. No. 476,515. Dated June 7, 1892. The invention is designed to set the second hands of clocks, watches and other time-pieces by means of a toothed slide or rack-bar and interposed gearing. When the setting has been accomplished, the operator releases his hold on the slide, when a spring operates to force the slide to one side out of engagement with the gear.

BEOLLEE AND TOASTER.—Thos. Barnett, S. F. No. 476,503. Dated June 7, 1892. The object of this invention is to provide a broiler and toaster of a shape and construction adapting it to be readily inserted in the fire chamber of the stove, preferably through a single griddle hole and to rest directly upon the coals, its handle and turn-rod extending upwardly out of the stove top in convenient and cool position, whereby the device may be readily handled both in insertion and removal and reversing while it is in the stove. It consists of a suitably constructed retaining frame connected with its handle by a hinge joint in such manner that it can be readily reversed to turn the material over.

EDUCATIONAL APPARATUS.—Wm. H. Leek, Quincy, Plumas Co. No. 476,568. Dated June 7, 1892. This "educational apparatus" consists of a series of interchangeable vertical rollers, with belts passing around them, a driving mechanism and shafts to which the rollers are removably attached, and a means of exposing either surface of the belt as it passes from one roller to the other. The object of the invention is to provide an apparatus by which a series of mathematical problems, words, sentences or other educational matter may be caused to pass slowly across one or more openings, through which they may be seen during

the time of passage only, for the purpose of inducing the pupil to concentrate his mind upon the problem during the brief time while it is passing, and to correctly catch the combination of figures or words as they pass and rapidly complete the work to be done before another proposition appears. It enables the teacher to instruct a large number of pupils at one time with comparatively little labor, and is valuable from the fact that the pupil must complete each piece of work as it appears before the opening, or lose the opportunity altogether.

WICK ADJUSTER FOR LAMPS.—Alexander J. McAdam, S. F. No. 476,477. Dated June 7, 1892. This invention is adapted for that class of lamps in which a wide wick is employed, and it consists essentially in a vertically-moving or tilting feed-shaft or spindle, the object of which is to tilt the wick in a vertical plane while burning, by raising or lowering one end more than the other. This results in leveling the wick and avoiding the necessity of that careful trimming which is usual to make the flame equal throughout its length. Though the invention is applicable to all lamps, whether for heating or lighting, it is best adapted for a lamp stove.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 7, 1892.

476,598.—TRAVELING BAG—A. Bancroft, Portland, Or.
476,508.—BEOLLEE AND TOASTER—Thos. Barnett, S. F.
476,601.—WAREHOUSE GANO PLANK—O. J. Boeselager, Mt. Angel, Or.
476,515.—HAND SETTING MECHANISM FOR CLOCKS, ETC.—A. Bradley, Redding, Cal.
476,263.—CALENDAR—J. Guidinger, Los Angeles, Cal.
476,657.—LETTEE BOX—A. N. Klein, S. F.
476,766.—TOUCH REGULATOR FOR PIANOS—F. W. Kringle, Los Angeles, Cal.
476,468.—EDUCATIONAL APPARATUS—W. H. Leek, Quincy, Cal.
476,733.—RAIL JOINT—J. N. Lewis, Conlee City, Wash.
476,287.—SASH BALANCE—J. P. Magney, S. F.
476,477.—WICK ADJUSTER FOR LAMPS—A. J. McAdam, S. F.
476,757.—WELL BORING—G. A. Miller, Colfax, Wash.
476,670.—BICYCLE TIRE—Mitchell & Veitch, Oakland, Cal.
476,482.—PAPER HOLDER—D. F. Oliver, Oakland, Cal.
476,497.—AMALGAMATOR—A. M. Stetson, Oakland, Cal.
476,698.—PESARY—H. H. Taylor, Fresno, Cal.
476,699.—TELESCOPIC FLAP SUPPORTER—C. S. Terpening, Prescott, Wash.
476,500.—CONCENTRATOR—Jas. Tulloch, Angels, Cal.
476,706.—DAM—O. Van Oostrum, Portland, Or.
476,707.—WHEEL CULTIVATOR—F. W. Vaughan, S. F.

The following brief list by telegraph, for June 15, will appear more complete on receipt of mail advices:

California—San Francisco—George W. Parker, floor or roof for buildings and light-transmitting floor or sidewalk; William A. Downing, ticket punch; Wm. B. Frederick, paint compound; Milton R. bumper for vehicle springs; Wm. Skyrme, safety car; John D. Mortimer, Stockton, hotel desk; Jonathan A. Tibbis, San Diego, bass-bar violin, tenor viol and bass viol; George Gales, Jackson, concentrator; Chas. F. Lane, Tulare, washing machine.
Washington—John T. Bibb and A. N. Tucwell, Spokane Falls, automatic sack filling and sewing machine; Charles P. Taro, Spokane, electric railway; Daniel Mentzel, Spangle, brake attachment for the steam wheels of heaters; James W. Fisher, Palouse, car brake.
Note—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail for telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Mining Share Market.

SAN FRANCISCO, June 16, 1892.

Immediately following last week's issue of the MINING AND SCIENTIFIC PRESS, mining shares were advanced slightly and kept up until Monday, when they began to set back. On yesterday (Wednesday) lower prices were touched by the shares in the Gold Hill mines than for several years past. The other shares, excepting those in Savage, Hale & Norcross, Best & Belcher, Con. Virginia and Ophir, sold lower than at any time since 1886. Just before the Con. Virginia deal in 1886, Ophir's shares sold at 35 cents, and in the deal they sold up to \$35. Other North End shares, outside of Con. Virginia's, advanced in like proportion from equally as low figures. The Gold Hill and Middle shares sold higher just before the 1886 deal than did the North End shares, but the latter sold the highest in the deal, but in the 1887 deal the Gold Hill shares, under the lead of Confidence and Challenge, sold the highest. There are many shrewd operators who look for similar deals either in the autumn of this year or in the spring of 1893. As we have had several years of strong depression and a steady concentration of stocks, it should not cause surprise if their opinion is well grounded, for at the moment everything is in readiness for a deal. The upper levels of about every mine on the Comstock is well developed to the west, and it is known that from the rich gold-bearing West or Red lode, only three or four mines have extracted much ore. The lode, which is nearly all gold, to the west can be run into on several levels to nearly all the mines with a few days' work. It is undoubtedly the knowledge of this fact that has caused the rings to break mining shares to such low figures, so as to get the last share they can. The rings find that, through the vigilance of the Mining Stock Association, mine-looting has become dangerous, and if again attempted, the leaders may find themselves in different quarters from the luxuriously furnished rooms or houses which they now enjoy.

THE MINING AND SCIENTIFIC PRESS believes in letting bygones be bygones, provided the rings either sell or lease the mills to the mining companies, and also place in positions of trust at the mines men of unquestioned honesty, and also have appointed mine superintendents who are experienced and reliable miners. The most, if not all, of the superintendents have held that position by being both blind and deaf—blind to mine-looting and deaf to the cry of the robbed stockholders. If the members of the rings and directors of the companies will not turn over the mills to the mines and appoint reliable men to superintend them, the rings and directors all should be criminally prosecuted. They cannot plead ignorance. But if, as above stated, they sell or lease the mills to the mines and make other reforms, then those who are now fighting the rings to secure these reforms should withdraw all suits and let bygones be bygones.

It is claimed by persons who should know that the rings have more shares in the Hale & Norcross mine, and to get them cheaply J. L. Flood gave his dummy president instructions not to have any more ore extracted and milled. On several of the upper levels in the mine, experienced miners say there is very rich ore to the west that will pay handsome dividends, provided the mine is honestly worked and the rings are reduced at a mill owned or leased by the company.

Julius Hebbard, in the Fox suit against the late directors of the Hale & Norcross mine, found Alvinza Hayward and H. M. Levy guilty of conspiracy. Attorney-General W. H. H. Hart, one of the directors to represent J. L. Flood in the Hale & Norcross mine, in the Seg. Rich case, of which mine H. M. Levy is vice-president. J. L. Flood is said to have authorized a statement to be published that Alvinza Hayward and he are bosom, or something similar, friends, and yet Attorney-General Hart has been appointed attorney, it is said, by J. L. Flood's directors in the Hale & Norcross, to prosecute Hayward, Levy and others to recover money claimed by them. He has unhesitatingly paid out for lawyers' fees, and also to aid in recovering for the company the \$1,011,000 judgment against Hayward, Levy and others.

Mining men say that the ore in Potosi does not assay over \$20 a ton, and yet the ore milled pulp as high as \$27 a ton. The question naturally presents itself, does the company get rich ore out of Potosi to mix in with that taken out of their own? From all that we can learn, there are surprises in store for the street, and that the old saying, "dead men cannot tell tales," may be proven fallacious, so far as mining on the Comstock is concerned.

News from the outside mines continues favorable, yet men in position to know say that the mine managers are not yet ready to show up much, if any, ore. From the Comstock mines reliable private advices continue uniformly favorable. In each group of mines rich ore can be extracted and the share market made to respond, but for some unaccountable reason only the poorer grades are taken out. The rich ore is extracted and milled, the best of it is probably taken in by the "little jig," for the benefit of the mill rings. In Savage, Con. Virginia, Belcher and Overman the developments are larger and richer than the public is led to believe.

MECHANICAL PROGRESS.

Learning To Be a Mechanic.

The skill necessary to draw a file straight is not easily acquired. Many a weary half hour at noonings and early mornings I have spent in practice with a block of cast iron and a testing straight edge; but the trained muscles at last responded to the desire for straight lines and perfect levels, both in draw filing and cross-filing.

Pertinacious practice gradually taught how to hit the head of a cold chisel when swinging a hammer from the end of an 18-inch handle. The lesson was thorough, adds the writer in the *Mechanical World*, and was not forgotten after the black and blue bruises on the left hand had disappeared. Indeed, nothing that a man learns by this method of instruction, experience, ever leaves him; it is part of himself. That is one reason why old mechanics, even after they have their physical ability impaired by age, are valuable in the shop.

My apprenticeship in a machine shop was under a good workman, but a poor instructor. During the temporary absence of the proprietor, the chart for the only screw-cutting lathe was lost. It was on a paper, tacked to a shingle or thin board, and one breezy summer day was blown out of the window and into the river, on the bank of which the shop stood. It was required to cut some screws in the lathe, eight threads to the inch. The pitch of the leading screw was six threads. Reasoning and thought finally brought about the result that the leading screw should be retarded in its revolutions so that it would travel on its hearing only six-eighths as fast as the blank screws on their centers. Six-eighths is three-fourths; so if a wheel can be put on the spindle of the lathe—the blank screw—that is, three-fourths the power of that on the leading screw, the thing is done. It was already known that an intermediate gear, which was required to drive the blank screw and the leading screw in the same direction, gave only "tooth for tooth," and therefore did not count. An overhaul of the gears was made to find two that bore the relation of six to eight or three to four. Gears relatively with the 45 teeth and 60 teeth would do, these numbers being multiples of 15 by three and four; 60 and 80, multiples of 20 by three and four, would fill the bill, so would the multiples of 30 as 90 and 120. One of these pairs was selected and the screws cut. Never after did the writer care for a lathe chart. Given the pitch of the leading screw, and that can be counted by a pocket rule and a collection of gears, and the combination can readily be made.

There is one other item in learning to be a mechanic that the apprentice should know and remember, and that is that the end of his apprenticeship is only the end of his apprenticeship; he has not "learned his trade," as many claim. The mechanic who "knows it all" is not generally worth shop-room. The practice of mechanics, or science, applied to the useful arts, cannot be fully comprehended and appropriated by any man in the period of his mortal life. He is the best mechanic who has never fully learned his trade.

The Breaking Strain of Wire Joints.

It is an axiom in mechanical designing that the strength of any structure is that of its weakest member, and the application of this rule to electrical work is eminently exemplified in the construction of overhead electrical conductors. Joints are of necessity of frequent occurrence, and hence it becomes all the more important to take special care in order to avoid any weakening of the lines at such points. Beginning with the early days of the telegraph this was well recognized, and from that time until the present, not a little thought has been given to the devising of joints in line wires, with the result that a variety have come in more or less general use. With a view of obtaining independent and reliable information as to the merits of these different types, Mr. Francis W. Jones, electrician of the Postal Telegraph Co., confided to Mr. M. M. Davis the testing of a number of joints. The results published in the *Electrical Engineer* show that in this detail, as in all others in electrical work, care and attention are necessary in order to secure the best results. Some of the joints in common use, like the ordinary unsoldered twist joint, proved to be little more than half the strength of the remaining part of the wire, while on the other hand the Britannia joint gives nearly the full strength of the wire. It should be pointed out, however, that these tests show merely the character of the various joints as related to hard-drawn cop-

per wires, and that in all probability the ratio of breaking strain would vary for different material, as hard-drawn copper wire exhibits peculiarities which are not possessed by iron or steel, or indeed by soft copper.

"HORSE POWER" OF BOILERS.—If the boiler is new, or has never been tested, the heating surface is the best guide to a knowledge of what it will be capable of doing. If the boiler is well designed, and properly set, two pounds of water should be evaporated for each square foot of heating surface, so that, on the Centennial Committee's basis, 15 square feet of heating surface should be allowed per horse power, and in estimating the horse power of a boiler the external surface of that portion of the shell which is exposed to the fire should be estimated, and to this, expressed in square feet, should be added the area of the tubes, and of such portions of the heads as are exposed to the direct heat. The sum should then be divided by 15, and the result is the nominal horse power of the boiler. This rule is not absolute, but, like all other rules, it has exceptions. With the most approved settings, and with well-managed fires, the evaporation is greater than that estimated above, and we find that in such cases 12 square feet of heating surface will evaporate the quantity of water required for a horse power. In some exceptional cases the requisite heating surface is even less than 12 square feet, but we do not use less than 12 unless we have satisfied ourselves, by careful experiment upon similar boilers, similarly set, that we may do so fairly. On the other hand, if the boiler or the setting is poorly designed, or the draught more imperfect, or the fires badly handled, more than 15 square feet may be required. There is no such thing possible as an absolute rule for the horse power of a boiler, and the rule we have above merely represents what, in our experience, a given boiler, well-designed, may be expected to do under ordinary circumstances.—The Locomotive.

THE LARGEST LATHE.—What is claimed to be the largest lathe ever built in this country, and perhaps in the world, has been completed and shipped to the Washington Navy Yard, where it will be used for turning and boring the 16-inch breech-loading rifles. This mammoth piece of machinery is designed especially to permit the use of a broad, flat turning tool, fed at right angles to the axis of the gun, which involves very powerful feeding gear and a quick traverse for moving the tool carriages and slide rests. The bed of the machine consists of a wide part for the head stock, tool carriage and steady rests 73 feet 10 3/4 inches long, 9 feet wide and 2 feet deep, made in two sections bolted and keyed together, and of a narrower part to support the boring bench 54 feet 5 inches long, made in two sections bolted and keyed together and to the main bed. The wide part, or main bed, has four ways, two of which carry the tool carriage on one side, and the other two serve to hold the steady rest and tailstock on the other side. The middle ways are formed in one section of metal, with a diagonal slot between them for clamping bolts. The narrower part or boring bed has no slot, and the boring bench is clamped to it by outside shoes.—Manufacturers' Gazette.

THE HARDENING OF MAGNET STEEL. Samples of different steels were heated in a furnace to various temperatures and hardened in water. They were then magnetized in a coil, and the temporary and the permanent magnetism determined. Both were greatly affected by the hardening temperature, and the effect of differences in the hardening temperature increased with the increase of carbon in the steels. Each steel had a particular temperature, which gave a maximum permanent magnetism—silver steel a little below 900 degrees, tungsten steel 920 degrees and a third sort 850 degrees, etc. When quenched at the temperature which gives greatest permanent magnetism, a magnet is no more liable to lose its magnetism from rough usage than when it has been hardened at a higher temperature.

A VERY large locomotive is now being built at the works of Messrs. Brown, Boveri & Co. at Baden, Switzerland. This engine, says a German contemporary, will be fitted with dynamos of a total of 1500 horse power, but which could be increased up to 2000 horse power. The power will be transmitted to eight electro-motors, arranged on the same number of axles. It is said that this locomotive will attain a higher speed than is usual with steam locomotives, and trials of its capabilities are to be made at the end of the summer.

SCIENTIFIC PROGRESS.

THE MATERIAL CARBORUNDUM.—The possibilities of electric lighting in the future, as expressed in the theories of Nikola Tesla, in connection with the use of the new discovery of carborundum, are extremely expansive and glowing. Electric lamps operated without any wires at all; an inexhaustible store of electrical energy on tap everywhere without need of either generation or transmission; the distribution of 100,000 volts without difficulty; and twenty times the efficiency of our present electric lamps, will be very wonderful things—when they are done. It is a matter of interest to know that such things are expected by an electrician of world-wide fame; but with regard to all such expectations, an ounce of demonstration is worth several pounds of theory. There are more tangible, though somewhat less magnificent, results from the actual development in Western Pennsylvania industries of the new material carborundum, the qualities of which are enlarged upon in the same connection. A material that, in addition to its value for electrical lighting, has the industrial uses set forth in the article, is a valuable addition to our industries. It has been an abstract rather than practical idea in the progress of science for some ages that diamonds might be artificially produced. This discovery seems to realize that dream, and even surpass it, so far as the industrial uses of the precious stones are concerned. It marks another step in the triumphant march of scientific industry.

AN ELECTROLYTIC EXPERIMENT.—In *La Lumiere Electrique* the following electrolytic experiment is described; it is due to Herr Arons, and was shown by him to the Berlin Physical Society: If we place a hollow copper cylinder between the electrodes of a sulphate of copper voltameter, copper will be deposited on the cylinder where the current enters it and dissolved where it leaves. If the cylinder is free to turn about a horizontal axis, it will commence to rotate as soon as the current passes, owing to the surface next the anode becoming weighted. It is possible to arrange matters so that the specific gravity of the cylinder is only a trifle greater than that of the solution, and hence the pressure of its axis upon the supports may be indefinitely reduced. The containing vessel used by Herr Arons was a glass box. The copper cylinder, which occupied nearly the entire width of the containing vessel, was 4.5 cm. long and 10 cm. in diameter, and the walls were about 1.8 mm. thick. The spindle was formed by a glass rod 1 mm. in diameter, secured to ebonite plugs fixed into the cylinder; the spindle rested on ebonite supports, attached to the walls of the containing vessel. The cylinder turned slowly and continuously under the influence of currents varying from 0.1 to 1 ampere. Experiments showed that the speed of rotation was very nearly proportional to the current.

CHLORIDE OF NITROGEN.—Chloride of nitrogen is the most wonderful as well as the most powerful explosive known. For 77 years, from 1811 to 1888, the secret of the composition of this terrible explosive was a mystery. Dulong, who lost one eye and three fingers in the year 1812 in a vain effort to determine its component parts, was the first man of scientific attainments to give the stuff thought and study. Later on, Faraday and Sir Humphry Davy devoted a great deal of time and attention to it. Before entering the laboratory both Davy and Faraday always provided themselves with thick glass masks to protect their eyes from flying pieces of glass, which were most sure to start on a tour of the room whenever a drop of the dangerous stuff was exposed. Faraday once narrowly escaped death as a result of making an experiment with two drops of the yellow, oily agent of death, which he had dropped into a small silver thimble prior to making an experiment, and at another time had his table ruined and the glass mask on his face broken into bits by less than one grain of it. In 1888, as above hinted, Dr. Gattermann of Gottingen, Germany, succeeded in analyzing the mysterious compound. It is the only known substance that will instantly explode on coming in contact with a bright beam of light, whether the beam be from an electric lamp or the sun.—St. Louis Republic.

NEW COATING FOR METALS.—The new coating for metals, based on the remarkable adaptability of cottonseed to unite with lead, has, after a thorough test, been found to give surprising results in resisting the effects of weathering and water. Five litres of cottonseed oil, says the *Pittsburg Dispatch*, are placed in a metallic vessel, and 10 kilograms

of lead are melted separately in an iron ladle. When the lead is molten, which requires a temperature of about 335°, it is poured gradually into the oil, and stirred about so thoroughly that every particle of the lead is subjected to the action of the oil. The mixture is then allowed to cool. When the oil is poured off the lead is found at the bottom, but reduced in weight to 8.5 kilograms, the remaining 1 1/2 kilograms having been absorbed by the oil. The residue at the bottom of the vessel is again submitted to the process of heating and stirring, which is continued five times, after which the maximum impregnation of five kilograms is obtained. When quite cold the oil has the appearance of thick varnish, and is ready for application, either with a brush or sponge. This coating unites quickly and firmly with any material. The first coat should be allowed to dry 48 hours before the second is administered.—Artizan.

ELECTRICAL COMMUNICATION BETWEEN ENGINE DRIVERS AND SIGNALMEN.—With a view of eliminating from the block system of protecting railway trains in transit the element of human fallibility, and thereby rendering it perfect, Mr. S. Lichtenfeld has invented an ingenious system of electrical communication between engine drivers and signalmen. This system we recently saw satisfactorily demonstrated by working models at 93 Great Portland street, London. Mr. Lichtenfeld places at intervals in a block-section insulated bars which are laid between the rails, and are connected by conductors with the cabins at each end of the section. There is also a series of treadles which, like the bars, are electrically connected with indicating and signaling apparatus in the cabins. As the engine passes over each treadle or bar, it makes contact by means of a spring piece fitted under it, and announces its position on the line to the signalman. In this way the signalman is made aware of the precise location of every train on his particular block section at any time. If he wish to stop any train, he communicates with it when it is passing over a bar, a bell on the engine being sounded. The engine driver then pulls up and can talk with the signalman while in contact with the bar. A bell and apparatus are also placed in the front and rear guards' vans, but the control is given to the driver. The system has been inspected by the electricians of several of our leading lines of railway, who are said to have expressed themselves very favorably upon its merits. Iron.

THOUGHT-WAVES.—In a lecture delivered by Prof. E. J. Houston before the electrical section of the Franklin Institute, Philadelphia, that gentleman in an extremely interesting manner attempted to correlate to some extent the phenomena of thought with grosser physical phenomena. On the assumption that thought is accompanied by molecular or atomic vibrations of that part of the brain called the cerebrum, he proposes a hypothesis to account for mesmerism, hypnotism and other cognate phenomena. In support of this hypothesis he cites his own experience, which can be corroborated by many others, that in taking charge of a class as a teacher where a number of bright students are undergoing examination, he experiences great mental exhaustion. He suggests that it is possibly caused by the rapid dissipation of energy by the cerebral radiations being absorbed by the receptive brains of the students, in a manner analogous to the well-known fact that when sympathetic vibrations are being excited by a sounding tuning-fork in a body near it there is greater rapidity of expenditure of energy of the fork's motion than when it was not exciting such waves.

THE TELEPHONE AS A GALVANOSCOPE.—The use of the telephone as a galvanoscope, especially when employed in connection with portable testing apparatus, though often pointed out, has frequently met with unsatisfactory results, owing to the fact that the complete silence which would indicate a balance in the Wheatstone bridge can rarely be obtained. The reasons for this are pointed out by Prof. Brown Ayres. He shows that when employing a circuit breaker we are not dealing with a simple harmonic current variation, but with a complex one, so that if a balance be obtained for one component, there are others still which would give indication of their presence in the telephone. The remedy for this is pointed out, but, unfortunately, cannot be generally applied in practice.

It is now generally held by electricians that the principle of the aurora borealis is the same as that shown by the Geissler tube in which electricity is discharged through rarefied air.

ELECTRICITY.

Electric Light in Lighthouses.

Electric lights in lighthouses, says Prof. Tyndall, are useless in a fog and a nuisance to mariners on clear nights. In the latter case they dazzle the eye and mislead as to distance. In a fog the 7,000,000 c. p. electric light at St. Catharine's Point could not be seen by the North German Lloyd steamer, "Eider," on the night of Feb. 2d at a distance of 3½ miles, and Prof. Tyndall thinks it probable that it would not have been seen in the prevailing dense fog at a distance one-quarter of a mile. This most powerful light in the world was, under the circumstances, no better than the 730 c. p. oil lamp it superseded.

To inform himself of the conditions, the *Engineering News* says, Prof. Tyndall sent a trained observer to the Isle of Wight with the following results: In a thin fog, at a point three-quarters of a mile away, the light gave a dull glow in the fog, which would have been mistaken for moonlight had it not been for the intermittent flashes of the light. As the fog increased in density, the light disappeared entirely, and at 500 yards from the lantern neither direct beam nor glow were to be seen. There was literally no indication of the proximity of a powerful light.

Prof. Tyndall says his own hopes and enthusiasm regarding the electric light have been sobered down by experience. He now strongly indorses the group flashlight of John Wigham of Dublin. In this light, as originally designed, five different processes were employed. The smallest one, for fair weather use, has 28 fish-tail gas jets compactly grouped, and this was increased, as occasion demanded, by groups of 20 jets, to 48, 68, 88 and finally to a larger fog burner of 108 jets. In the case of a revolving light, the larger the burner the wider is the beam sent seaward, and the longer the time occupied by the beam in sweeping past the mariner. So Mr. Wigham takes advantage of this 20 seconds of time by flashing his light, by suddenly quenching and automatically lighting the gas again a certain number of times. Mr. Wigham also removes the top and bottom prisms of the French apparatus, and superposes the central belts of prisms so as to build up a biform, triform or quadriform tower. At the focus of each tier he places his powerful burner, and thus triples or quadruples his light. This light is singularly satisfactory to mariners.

Transmission for Mining.

In a paper recently read before the Colorado Scientific Society, Mr. Irving Hale presents one of the most valuable contributions yet made to the discussion of the problem of the limitations of the distance in the economical transmission of power by electricity—a question which, in the mining regions of the West, is assuming great industrial importance. The world has been afflicted with much arrant nonsense, on this theme, from the mouths of authorities of high reputation who ought to know better, and who probably do know better. Mr. Hale makes a thorough analysis of the whole subject, subjecting it to the logic of cold facts and figures, without romance or guesswork. While freely admitting that under favorable conditions the application of the electric transmission of power in mining is "a successful and highly profitable reality," he strongly deprecates a certain tendency among electricians to look at the problem from a scientific rather than a commercial standpoint. The general conclusion reached by Mr. Hale, and abundantly fortified by the figures adduced by him, is that wherever in a mining district the cost of coal exceeds \$4 per ton, and water power is available at a reasonable cost within a distance of not more than five miles, the installation of an electric power transmission plant presents a very attractive investment for capital. But when it comes to greater distances, Mr. Hale's conclusions are supported by the opinion of an editorial writer in the *Electrical Engineer*, who recently pointed out that there must be an enormous reduction in the present cost of installation and maintenance before electric power from Niagara can be delivered, even no farther away than Buffalo, to compete commercially with steam now manufactured in that city at \$35 per horse power. There is much danger that capitalists may be led astray by visionary and uncommercial projects of this character, and the note of warning uttered by conservative electricians comes none too soon.—*Engineering Magazine*.

ON electric generators, for furnishing the

entire plant, \$50,000 has been saved the World's Fair. The generators must have a capacity of 3500-horse power. Of this amount, 1800-horse power cost \$2.50 per horse power. The remaining 1700-horse power cost \$1 per horse power. While this has not been an actual donation, it comes close to it, considering the fact that the electric combine wanted \$16 per horse power, or about \$56,000 for the plant, which is going to cost \$6200.

Futile Direction of Progress.

Besides the inevitable perpetual motion man, who is beyond reach of any argument or advice, even from his best friend, there is a class of men who are too intelligent to be included among the former, but who, nevertheless, are working in a direction in which a careful investigation would show that their attempts must prove futile from the very nature of the matter. Among these is the primary battery man, who claims to obtain more energy out of his battery than the zinc and solution are capable of giving. This subject, however, has been thoroughly discussed before, and we are pleased to see the number of such misled inventors is rapidly becoming small. But there is another point quite similar, which we fear is not so clearly understood, as we notice that it is occasionally brought out by inventors who do not regard our fundamental laws as being unquestionable, or who do not clearly understand such laws. It is the belief that more than 746 watts can be obtained to the mechanical horse power. The inventors who entertain this idea are misled by the fact that they think this figure 746 (or, more correctly, 745.941) was determined originally by experiments with our present forms of dynamo, and may, therefore, be improved upon by a departure from these forms. This, however, is an entirely wrong impression; any attempt to obtain a larger figure must necessarily be a waste of mental energy, besides involving useless expenditure of money. This number is obtained by calculation pure and simple, depending, therefore, on no experimental determination (other than the value of gravity, which it includes). The value for the mechanical horse power in foot pounds per minute is fixed by definition, as are also the values of the electrical units; this number, 746, is merely the connecting link between the mechanical horse power and the electrical units, precisely as the number 3.2809 is the connecting link between feet and metres, and it would be just as useless to try to get more feet out of a metre as to get more watts out of a horse power. Inventors who are working in this direction had therefore better stop at once and find out how this figure is obtained before wasting their time upon any futile attempts to get what cannot be got from the very nature of the case.—*Electrical World*.

ELECTRICITY ON STANDARD ROADS.—George Westinghouse expresses the opinion that the talk of operating standard gauge roads by electricity instead of locomotives is all "moonshine," and says: "It is a question of centralizing the power economically. Where anthracite coal must be burned, as on the New York elevated roads, it may be found economical to use soft coal to centralize the power. The present locomotives have very nearly the full efficiency of a stationary steam boiler. Now, to put in its place an electric motor connected by structure with a steam plant corresponding to an aggregate of all your steam boiler plants on wheels would be really duplicating your power equipment with but little advantage and no economies, while there is a reduced efficiency by reason of the transmutation of the heat units from the coal through dynamos and wires to an electric motor on wheels. In the present stage of electrical science, talk of the operation of standard gauge roads throughout the country by electric traction is wholly visionary."

INCREASING DEMAND FOR SEAMLESS TUBES.—In regard to the rapid growth in the use of seamless steel tubes, it is stated that Birmingham is the chief center for the manufacture of seamless steel tubes in variety, the increase in the industry being characterized as remarkable. Bicycle makers and engineers are the principal consumers in this line; indeed, wherever metal tubing is required that has to withstand an exceptionally great strain, and where the employment of steel is practicable for the purpose, the seamless tube is increasing in request. It is claimed to have added materially to the efficiency and durability of hydraulic machinery. A three-fourths inch tube with a core of one-half inch can be drawn in steel to withstand a pressure of 1000 pounds on the square inch, and it has now for some time been largely and satisfactorily used for

boilers instead of copper tubing; the cost is said to be considerably less, while its durability is as great, and, in the case of high class steel, its reliability will compare quite favorably with the ordinary copper tube.

USEFUL INFORMATION.

A COMPLICATED INSTRUMENT.—The beak of the mosquito is simply a tool box, wherein the mosquito keeps six minature surgical instruments in perfect working order. Two of these instruments are exact counterparts of the surgeon's lance, one is a spear with a double-barbed head, the fourth is a needle of exquisite fineness, a saw and a pump going to make up the complement. The spear is the largest of the six tools, and is used for making the initial puncture; next the lances or knives are brought into play to cause the blood to flow more freely. In case this last operation fails of having the desired effect, the saw and the needle are carefully and feelingly inserted in a lateral direction in the victim's flesh. The pump, the most delicate of all six of the instruments, is used in transferring the blood to the insect's "stomach."—*Discovery*.

CLEANING BRASS.—The method prescribed for cleaning brass in United States arsenals is said to be to make a mixture of one part of common nitric acid and half part sulphuric acid in a stone jar, having also ready a pail of fresh water and a box of sawdust. The articles to be treated are dipped into the acid, then thrown into the water and finally rubbed with sawdust. This immediately changes them into a brilliant color. If the brass has become greasy, it is first dipped into a solution of potash and soda in warm water. This cuts the grease, so that the acid has full power to act.

WASHINGTON COKE.—Fairhaven (Wash.) coke has met with another successful test, this time in the largest coke-consuming region of the West. Two carloads were recently shipped to Butte, Mont., for trial in smelters. Thomas Couch, superintendent of the Boston & Montana Copper Co., in a letter containing the results of the trial of this coke in the smelters of the company, states that they started with the same quantity and same charge they had been smelting, and attained the same results as had been attained when Pennsylvania coke had been used all the time.

ON the Exposition grounds there will be required steam engines of a capacity of 20,000 horse-power. The combined value of these engines is estimated at \$2,000,000. The Exposition company will secure the use of this plant for \$1. This is only one of many donations. The water for fire protection at Jackson Park will be supplied by four Worthington pumps with a total capacity of 40,000,000 gallons per day. These pumps cost the World's Fair just \$1. Their value is estimated at \$150,000.

IMPREGNATING TIMBER.—An Austrian method of impregnating timber with zinc chloride, known as the Pfister process, consists in fastening an iron cap over the thick end of the newly-felled log, and applying the solution with a force pump. The sap soon exudes at the other end, and is finally followed by the zinc solution. The process requires but a few minutes, but has the defect of distributing the preserving solution rather unevenly.

SOME immense irrigation works are under way in Australia. The Victorian Water Supply Department has made drawings and estimates for a new reservoir which will cost \$1,250,000. The Goulburn Weir, which serves to deliver water to a channel 23 miles long leading to this reservoir, has been already constructed at a cost of about \$500,000, and 15 of the 23 miles of channel have been completed at a cost of about \$1,000,000.

ROSEWOOD.—Many people suppose that rosewood takes its name from its color, but this is a mistake. Rosewood is not red or yellow, but almost black. Its name comes from the fact that when first cut, it exhales a perfume similar to that of the rose; and although the dried rosewood of commerce retains no trace of this early perfume, the name lingers a relic of the early history of the wood.—*St. Louis Globe Democrat*.

AN acid which seems to have a peculiar solvent action upon the oxides and yet leaves the metallic surface intact, is oleic, and when combined with finely-powdered Venetian red and cleaning fluids, it leaves little room for improvement in cleaning and polishing brass.

GOOD HEALTH.

City Dust and Catarrh.

At a recent meeting of the Kings County Medical Association, Brooklyn, N. Y., Dr. W. H. Bennett read a paper (published in the *Sanitarian*) on "Dust and a Polluted Atmosphere as Prime Factors in Causing Chronic Catarrh of the Upper Air Passages." The author says: Considering the exposed position of the parts, it is not to be wondered at that chronic catarrh of the superior respiratory tract, in cities and large towns, is the most common of all affections, both in man and the domesticated animals, even the dogs in the street being not uncommonly affected.

By chronic catarrh of the upper air passages, I wish to be understood as meaning chronic nasal catarrh and chronic nasopharyngeal catarrh, generally coexisting. In my opinion, the principal source of catarrh of the upper air passages is the atmosphere we breathe. Repeated, neglected, acute or subacute attacks undoubtedly play their part by rendering the mucous membrane more vulnerable, and in exceptional cases may even give rise to the disease when the patient is continually exposed, and the parts, in consequence, frequently congested; but it is the filthy condition of the atmosphere we respire that constantly irritates the unprotected mucous membrane, and it is the prime factor causing and perpetuating the hyperæmia, the swelling and the tumefaction—the condition, in short, which we recognize as chronic catarrh.

The atmosphere we breathe is filled with suspended matter of the foulest and filthiest kind, in the shape of dust particles ground from the pavements, ashes, the dejections of animals, the dried and pulverized sputa of a million persons, garbage, dead animals and offal, besides the poisonous gases from ten thousand factories and sewers. Then there is the soil saturated with illuminating gas, which is constantly being given off into the air.

In opposition to all this it may be said that the disease is very generally prevalent over the whole country; but this statement requires qualification. Catarrh is most common in large cities, and the dirtier and dustier the place the more prevalent it is. A changeable climate, particularly if damp, may favor the development of the disease, because there will, in such a locality, be more frequent acute attacks; but it will be found, I think, other things being equal, that the more dust in the air (pulverized filth, I mean, not clean dust) the more cases of catarrh one will meet. The dust of the streets is not alone responsible for the frequency of the disease; we have dust and contaminated air in our houses also, notably in theatres, saloons, ball-rooms, and places where many are gathered, and we must not overlook the poisonous gases resulting as products of combustion from our methods of illumination, from stoves and furnaces, and last but not least, remember the connections with the sewers. Even in the best kept and best regulated houses the carpets, than which nothing better as a receptacle could possibly have been devised for the purpose, will always keep the atmosphere loaded with impurities in the form of suspended matter, every footfall sending it up in clouds. Why is it that clerks and shop-girls in large retail stores all have catarrh, more so than laboring men and those whose occupations keep them out of doors, and consequently in a better atmosphere, if the quality and condition of the atmosphere have nothing to do with it?

There is another circumstance that I would here allude to. During acute catarrhs efforts at ridding the affected parts of the increased secretion, as hawking and blowing the nose, frequently cause abrasions of the membrane. Now even if it be denied that the dust and dirt of a polluted atmosphere, when continuously inhaled, have any influence in creating and perpetuating the disease in its chronic form when the membrane is intact, it certainly must be admitted, it seems to me, that where there is a loss of the epithelial covering at any point, there contact, and especially prolonged contact, with such an atmosphere must tend to aggravate and prolong the acute attacks, which often become chronic where otherwise speedy resolution would be the result.

Again, it frequently happens that an acute catarrh hangs on indefinitely in a subacute form while the patient remains in the city, but disappears at once without treatment on his removal to the purer air of the country. Moreover, it is a common thing to hear persons affected with mild forms of catarrh say that they experience relief in a few hours after they get out of the city into a comparatively pure air.

TABLE OF CONTENTS.

EDITORIALS.—Buffalo Steam Pumps; An Amalgamating Device; 430. Steel Ship-Building; Insincere; The Valley County Convention; 446. Deep Conglomerate Mines; Ore Masses and Dykes, 447. ILLUSTRATIONS.—Compound Condensing Mining Pump; Buffalo Duplex Power Gear Pump; Buffalo Duplex Boiler Feed Pump, 439. Deep Conglomerate Mines; Ore Masses and Dykes, 447. CORRESPONDENCE.—Kanlopes Mining District; Mining in Montana; Reno Reduction Works; Arizona Copper; Coal at Nansimo; B. C.; A Code of Mine Signals; A Revival in Mining; Works at Anconada; The Big Telescope; Coking Coals of Washington; The Euika Mine Tested; Use of Graphite, 441. MECHANICAL PROGRESS.—Learning to be a Mechanic; The Breaking Strain of Wire Joins; "Horse Power" of Boilers; The Largest Lathe; The Hardening of Magnet Steel, 444. SCIENTIFIC PROGRESS.—The Material Carbonadium; An Electrolytic Experiment; Chloride of Nitrogen; New Coating for Metals; Electrical Communications Between Engine Drivers and Signalmen; Thought-Waves; The Telephone as a Galvanoscope, 444. ELECTRICITY.—Electric Light in Lighthouses; Transmission for Mining; Futile Direction of Progress; Electricity on Standard Roads; Increasing Demand for Seamless Tubes, 445. USEFUL INFORMATION.—A Complicated Instrument; Cleaning Brass; Washington Coke; Impregnating Timber; Rosewood, 445. GOODYEAR.—City Dust and Catarrh, 445. MINING SUMMARY.—From the Various Counties of California, Nevada, and other Pacific States and Territories, 442-443. MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 450.

Steel Ship-Building.

The iron and steel ship-building interests of San Francisco are in a prosperous condition and steadily growing in importance. The Risdon Iron Works will shortly engage in this branch extensively, and are now making arrangements to establish a plant. In the reorganization of the business of Fulton Iron Works, the ship-building feature will be more prominent than heretofore, though these shops have already done a large share of the marine engine work of the coast.

The Union Iron Works, in the possession of a complete plant by the waterside, with dry dock, launching ways and every appliance for ship-building in all its branches, has now, naturally, the bulk of the work. Having proven their ability to build the types of vessels which compose our new navy, and with a large amount of this work still in hand, they also have facilities for constructing tugs, steamers, etc., for commercial purposes. On Saturday night they launched from their yard a fine steamer for the China line, the largest steel passenger and freight steamer ever built on this coast. Outside of the steel plates used in the hull and boilers, the steamer is the product of California labor from stem to stern. The Peru is 350 feet in length, has a beam of 45 feet and a depth of hold of 27½ feet. The gross tonnage will be about 3615 tons, or 67 tons greater than the steamer City of Rio de Janeiro. The Peru is six feet longer than the Rio and has seven feet more beam. The engines are of the triple expansion type, the six boilers of 2800-horse power, and it is expected with this power that the Peru

will be able to attain a speed of 15 knots an hour. The Rio on her last trip to China attained a speed of 15 knots and the engines and boilers are an exact duplicate of those in the Peru, and were only put in four months ago.

The material used in the construction of the steamer is open-hearth steel made under special survey. There are three decks besides the hurricane deck, five water-tight bulkheads, steam windlasses, steam capstans aft, steam steering gear, and all the latest appliances for the rapid handling of cargo.

There are accommodations for 104 cabin, 75 second-class and 600 steerage passengers. The house on the spar deck, which extends nearly the whole length of the vessel, including staterooms, dining saloon and cabin, is of steel, while the house on the hurricane deck is of wood.

Electric lights have been placed in every part of the vessel. The interior cabins are finished in white and gold.

For cooling the refrigerator room, preserving meats and provisions and supplying ice, an Allen dense air machine has been supplied.

Delegates to the Mining Congress.

Mayor Sanderson has appointed the following gentlemen as delegates to the second session of the National Mining Congress which will meet in Helena, Mont., on July 12th next: W. H. H. Hart, John Hays Hammond, A. H. Boomer, Dr. W. D. Johnston, C. A. Luckhardt, T. R. Church, D. T. Hughes, Louis Janin, A. J. Bowie, Ross E. Browne, W. H. Martin, William Irelan, Jr., John Finlay, Thomas Price, Charles G. Yale (of the MINING AND SCIENTIFIC PRESS), W. S. Lyle, J. F. O'Gorman, Louis Glass, R. McMurray, Dr. E. Mellis, W. K. Aldersley, Paris Kilburn, J. Z. Davis, Isaac Trumbo, Winfield S. Keyes, Alexander Badlam, J. B. Hobson, H. D. Ranlett, William S. Chapman, Egbert Jud-Judson and N. J. Brittan.

This will be the second session of the National Mining Congress, the first session having been held at Denver, Colo., last year. Judge Niles Searles of this State was president of that Congress, and is president of the National Executive Committee. Robert McMurray of California is one of the vice-presidents.

The session next month will last from the 12th to the 16th, inclusive. It is earnestly hoped at this session to secure a complete and thoroughly representative participation in the deliberations of the organization. The potency of the discussion by eminent men of the general needs of our mining interests, cannot be exaggerated as to their helpful influence upon necessary legislation, and the value of interchanged ideas on these matters is unquestioned.

The Congress will convene this year in the very heart of an extensive mining region. The city of Butte is only three hours' ride from Helena, and the entire surroundings present an unparalleled opportunity for practical observation of the operations of mining and the treatment of ores in their highest state of perfection. During this session of the Congress there will be excursions to the cities of Butte and of Great Falls, the latter city being a point of special interest owing to the establishment there of great reduction works, utilizing the immense water power. At this season, too, a trip to the Yellowstone National Park may be enjoyed. The cooperation of all railways in the United States is assured the Congress, and the liberal concession of one fare for the round trip, with interchangeable return tickets from Helena, and 30 days limit in Montana, is announced as available to delegates from all points in the Union. Three transcontinental railway lines center at Helena, and from that point branch roads diverge to all sections of the State.

The Valley County Convention.

A meeting of Sacramento valley farmers, presided over by W. S. Green of Colusa, was held in Sacramento last Friday, when resolutions were adopted denouncing the Caminetti bill, debris dams, hydraulic mining, etc. Several members present endeavored to modify the sweeping resolutions so that they should be within reason, and conform to the understanding reached at the Miners' Convention, but did not succeed. The Committee of Conference appointed by the Executive Committee of the State Miners' Association was not treated very nicely. There was a long discussion as to whether they should be heard or not, and when finally it was decided to hear them, they had gone home. The farmers in convention did not want to hear from the other side, and apparently wanted nothing but their own way. They wanted no experiments with dams, and no bill which would help the miners in any way.

It is worthy of note that those gentlemen present who had attended the Miners' Convention in this city, and had heard both sides of the question, were much more liberal in their ideas than those who had looked at the matter entirely from the anti-debris point of view. Many who were opposed to the Caminetti bill had never read it, and their ideas were based on false premises.

It is useless to waste argument with men who will not see anything except their own side. There is this to say, however: The farmers opposing a settlement of this question now on a fair road to settlement will not be backed up by popular approval when it is seen they care nothing for the good of the State in general, but only for their personal interests. As the Sacramento Bee confesses, "the action of the Sacramento convention will look to the public more like an attack on hydraulic mining itself than a protest against that portion of it which will inflict damage on the valley and rivers. It savors enough of unfairness in spirit to cause an open rupture with the great majority of the Miners' Association who have unquestionably acted in good faith in discontinuing mining and in restraining, to the extent of their ability, their less honest colleagues."

The disinterested public of this State had hoped this conflict between farmers and miners was on its way to settlement without further friction. The people at this convention place the whole matter in a false light, and give rise to further controversy. This is greatly to be deplored, but certain fanatical partisans are not content to have such matters settled unless the advantage is entirely on their side.

A SILVER CONVENTION.—The Executive Committee of the silver clubs of Nevada has issued a call for a State Convention, to be held in Reno June 24th, for the purpose of nominating three presidential electors pledged to vote only for a free coinage candidate.

At a meeting this week of the Regents of the University of California, the offer of a friend of the Lick Observatory to bear the expenses of an expedition to Chile to observe the eclipse next spring was accepted, and arrangements were made for sending an astronomer there next February.

DODGE MILLS.—The Parke & Lacy Co. of this city, sold three Dodge pulverizing mills last week. One goes to Albuquerque, where work is to be carried on by an "electrical process;" another to work free-gold ores at Prescott, Arizona, and the third one goes to Australia.

THE old Vulture mine, Arizona, belonging to Senator Tabor of Denver, is being prospected under the direction of T. E. Farish. A vein of rich ore has been uncovered 300 feet from the old workings of the mine.

Insincere.

Among the resolutions passed by the Sacramento Farmers Convention on Friday of last week, was the following:

Inasmuch as it has been stated that the people of the valley favor, or have no objection, to the erection of dams in the navigable rivers of California, or their tributaries, for the purpose of permitting the resumption of hydraulic mining and in the belief that they will be effectual for that purpose, we solemnly declare that such dams will not restrain the debris that has done so much damage in the past and we are unalterably opposed to the erection of dams for the further prosecution of hydraulic mining. We deny that the engineers of the United States have reported that the erection of dams will restrain the matter that has injured the rivers, and as proof of this assertion we quote their own language, viz:

"These dams, however, will not be effective in impounding all the material delivered into the canyons from the mines. Being in the streams and in the pathway of the freshets, portions of the heavier material will be carried over the crests of the dams, to eventually find lodgment in the river below. The finer sands and clay cannot be effectually impounded by such barriers, but will be carried off in suspension."

This last paragraph from the engineers report has been many times persistently misquoted by professional antidebris agitators, and is again misquoted in this instance.

The exact language of the paragraph in the official report issued by Congress, is as follows:

"These dams, however, will not be effective in impounding all the material delivered into the canyons from the mines. Being in the streams and in the pathway of the freshets, portions of the heavier material will be carried over the crests of the dams to eventually find lodgment in the river below. The finer sands and clay cannot be effectually impounded by such barriers, but will be carried off in suspension. *With the improved condition which it is desired to give to the navigable rivers it is probable that the greater part of this fine material can be carried off without being productive of harm.*"

The italics to the concluding sentence are ours. It will be seen that the favorable conclusion of the engineers is suppressed by the framers of these resolutions, as it has been suppressed in every instance of the kind previously.

Now this is not fair fighting. Explicitly stating that they quote the language of the engineers, and then omitting the conclusion of the paragraph because it is unfavorable to their side, or does not express the opinion they want, is manifestly unjust to the miners, and to their own people as well.

It was never claimed that the finer as well as coarser material could be restrained. The engineers state that it cannot be. But they also state that the results obtained by dams now in existence show the feasibility of impounding the coarser material behind properly constructed barriers. They do not think it possible to prevent the movement of the finer sands and clays except by the construction of settling basins.

To separate the coarser and finer material, the dams must first be built, then the settling basins; but if the farmers prevent the building of the dams, no settling basins will be built.

There is a distinct conflict of opinion between the engineers appointed by the Government and the farmers on the subject of the feasibility of the dams. Whether the general public or Congress will consider that the opinion of farmers, with no experience whatever of dams of any kind, should outweigh that of experienced engineers, is extremely questionable; and the farmers' opinion will surely be considered of little worth when, to bolster up their cause, they misquote the statements of the engineers appointed by Congress to report on this subject.

At a recent meeting of the Harbor Commissioners the plans and model for a new steam tugboat, which were submitted by Contractors Hinckley, Spiers and Hayes, and as modified by the Board, were adopted.

Deep Conglomerate Mines.

After failing to work profitably an amygdaloid bed, the Albany and Boston made the first experiment in 1864 in working a conglomerate bed, and thus, although unsuccessful itself, was the forerunner of the most successful and important enterprise on Lake Superior. The Albany and Boston should therefore appear at the head of the group of conglomerate mines, followed by the Calumet and Hecla, in 1865, and by the Allouez conglomerate only in 1869. The Osceola appeared in 1873, but after working for a time on so much of the remunerative portion of the Calumet conglomerate as lay within its lines, it transferred its operations to an amygdaloid bed. The Tamarack, which tapped the Calumet and Hecla conglomerate on the dip of the great ore chute by a vertical shaft, commenced making copper in 1885, and is the last born of the conglomerate mines.

Several conglomerate beds alternate throughout the series of the Keweenaw rocks with the unaltered traps and with the copper-bearing amygdaloid. In many places they carry traces of copper, but the only conglomerate bed that gives assurance of economic value is the Calumet bed, where, for about three miles along its strike, it outcrops on Calumet and Hecla ground, on the northern edge of Osceola ground to the south, and on the southern edge of Centennial ground to the north (see engraving). In the center of this long stretch, Calumet shaft No. 1 was sunk in what has proved to be likewise the center of the most productive area of this vast chute of ore. Hecla shaft No. 1 adjoins it to the south (for the two companies were distinct until consolidated in 1872).

Within the Calumet lines there have been sunk five shafts, from 1 to 5, numbered from south to north, and within the Hecla and South Hecla lines 12 shafts, numbered from north to south. The disastrous fires of late years crippled the deep, central shafts and shut off temporarily all access to the rich ores of the central zone. But previous to the fire the 700-foot level had been run south to the limit of the Calumet and Hecla property, and had traversed a second chimney of ore in the southern part of the South Hecla, known as the Black Hills section of the mine. With extraordinary energy this almost unexplored territory was opened soon after the first fire occurred, and so rapidly was the work of development prosecuted that, although between the years 1886 and 1887 there was a diminution of product from 22,553 to 20,543 tons of copper, this was due, not to a contraction in the tonnage stamped, but to a decline in the richness of the ore from 4.22 per cent to 3.52 per cent. A large quantity of lean ore from the Black Hills mine, which was necessarily mixed with the richer ores of the central chute, caused the falling off. The next year (1888) showed a still further decline to 3.28 per cent of copper in the rock treated.

The deepest point reached by the Calumet and Hecla is the 29th level, which is 3750 feet from the surface on the incline of the bed. As the dip is $37\frac{1}{2}^\circ$, it makes the vertical depth 2280 feet. This depth corresponds with the fifth level of the Tamarack mine, but the bottom of No. 4, the deepest Calumet and Hecla shaft, is 4000 feet north of the No. 1 Tamarack shaft. It is therefore assumed that the Tamarack is working on the dip of the South Hecla or Black Hills chimney, and not on the central body. The sinking of the Tamarack vertical shaft to a depth of 2270 feet, on the chance of striking the Calumet conglomerate, was regarded from a mining standpoint as an act

of audacity, for when it was begun in 1882, the lower drifts of the Calumet and Hecla were far above the level at which the Tamarack shaft was expected to pierce the lode. But ere the goal had been reached, in 1885, the Calumet's deepest workings were approaching the same level; so that it became a foregone conclusion that the Tamarack hopes would be realized.

The Calumet has virtually opened up a

of three miles, besides the 25 inclined shafts, of which eight are deeper than 3000 feet, there are sunk, or being sunk, seven vertical shafts, the shallowest of which is 2270 feet, and the deepest of which will be 5000 feet."

Ore Masses and Dykes.

The Haile gold mine, in Lancaster Co., S. C., was opened as far back as 1832. The

third of its gold free and two-thirds in sulphurets can be profitably treated. At the Haile mine, 36,000 tons of such ore have been successfully treated, and it is moved and treated at the rate of 80 tons a day. This is the statement made by the inventor of the process, A. Thies, in a paper read before the American Institute of Mining Engineers. The process is not patented, and any one is free to employ it.

The ore at the Haile mines, says Mr. Thies, is a mixture of pyrite and stratified talcose slate. The strike of the strata varies from N. 52° E. to N. 73° E., and the dip (northwesterly) from 45° to 75° . The footwall is soft talcose slate, colored yellowish, brownish and red by iron salts, and showing cross joints. The hanging-wall is often, if not always, greenstone. From the footwall toward the hanging-wall there is a well-marked increase in the hardness of the ore. Bands of silicious matter appear, and veinlets and veins of almost pure pyrite, from the thickness of one-fourth inch to one and one-half feet. These streaks of pyrite cut across the slates in all directions, and are also at times parallel to them. Now and then masses of considerable hardness are also found near the footwall, but whether they occur here or in the vicinity of the hanging-walls, they are evidently derived from the talcose slates. It is believed that whatever be the earthy material mixed with the slates in the ore-bearing mass, it has been derived from the slates themselves. Even the very silicious material found near the hanging-wall, and bearing no resemblance to the slates either in color, hardness or stratification, was doubtless derived from them.

Several dikes, seemingly of diabase, cross the slates at irregular intervals. On the accompanying diagram they are shown as cutting the slates at right angles to their strike. This is not quite true; but the variations are slight. Between these dikes lie the immense deposits of talcose slates, impregnated with gold-bearing pyrite and with more or less free gold. The free gold

is generally fine. Wherever the slates are rich enough in free gold and pyrite, they are mined. The richer streaks are of various widths, from 2 feet to 30 feet, and are of the same general character as the main body of the slates. In immediate proximity to the dikes, as well as to the hanging-walls, the slates are, as a rule (with some exceptions), richer than elsewhere.

As to the correlation between the dikes and the ore masses, little will be said. That the dikes do influence the richness of the ore favorably seems to be beyond question, but it is not so easy to say why. Nor can we speak positively as to the nature of the dikes themselves.

MINERS COLLECTING PAY AT CREEDE.—Col. H. C. Chapin, president of the Crown Point Mining Co., was held up in his office at Jimtown on Wednesday by three of the company's workmen with a shotgun, who claimed they had not received their pay.

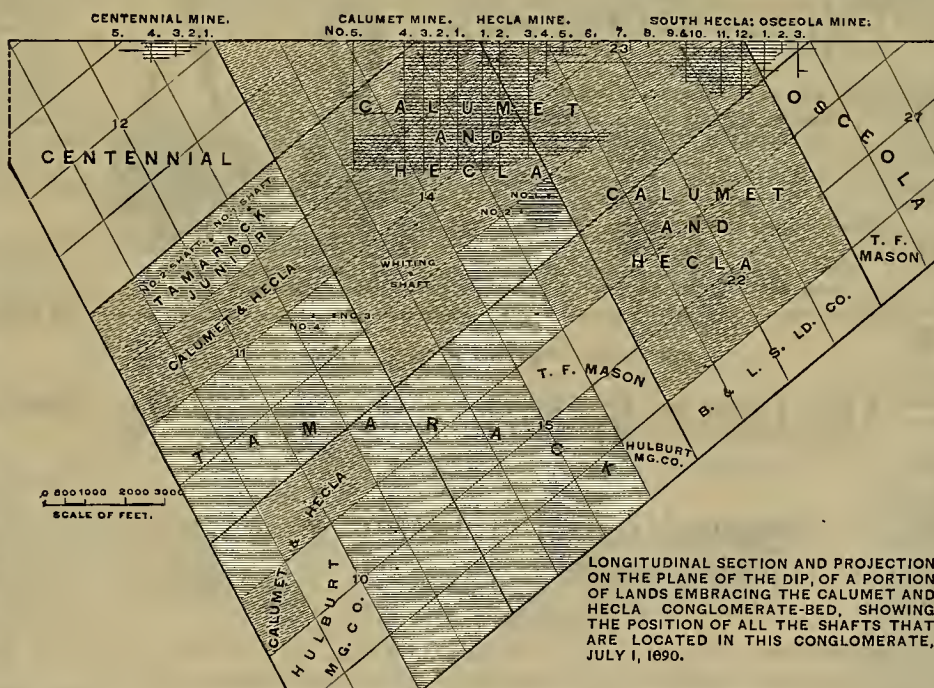

It was after banking hours, and Mr. Chapin had not the ready money. With considerable work, however, he succeeded in getting the cash, and the men departed. Much excitement was caused, and trouble is threatened for several minor companies, whose men have not been paid. Mr. Chapin was obliged to pawn his jewelry in order to raise the funds necessary.

THE CARSON RIVER MINING DRIDGE at Dayton is said now to be succeeding, after several failures in handling the material from the bed of the river. Some of the stuff brought up assays \$149 per ton.

new mine in the South Hecla; it has nearly reached its fortieth level, or a depth of 4000 feet, by its inclined shaft No. 4, and it is sinking a vertical shaft—the Whiting—which will touch the central chute of ore at a vertical depth of 3400 feet, or on the sixtieth level. Meanwhile, the Tamarack is

ore has been worked by various systems, until they finally, in 1888, took up the Thies process of barrel chlorination, by which many thousand tons of ore have been successfully treated. The Thies process is, in brief, the treatment of dead-roasted auriferous concentrates (pyrite, sometimes

LONGITUDINAL SECTION AND PROJECTION ON THE PLANE OF THE DIP, OF A PORTION OF LANDS EMBRACING THE CALUMET AND HECLA CONGLOMERATE-BED, SHOWING THE POSITION OF ALL THE SHAFTS THAT ARE LOCATED IN THIS CONGLOMERATE, JULY 1, 1890.

sinking a third and a fourth shaft, which should both intersect the central chute of the conglomerate at a depth of about 5000 feet; and Tamarack Junior, a company affiliated in ownership with the Tamarack, is sinking to the north of both the Calumet and Hecla and the Tamarack ground, in the hope of finding good ore below the Centennial property, a hope stimulated by the success of that latter company in striking remunerative ground to the north of its older workings.

These facts we take from a paper read by James Douglas before the Am. Inst. M. E., and he adds that "within this limited range

also chalcopryite, as at the Phoenix mine, N. C.) with nascent chlorine, without artificial pressure or exhaust, or lead-lined iron cylinders; the throwing of the mass on a sand filter; the quick filtration and precipitation of the gold chloride with fresh and active ferrous sulphate. The gold is precipitated as metallic gold of a reddish-brown color, which, after being allowed to settle completely, is collected, washed, dried and melted with soda and borax in graphite pots and cast into bars. The efficiency and economy of the process are such that, working on a large scale, crude ore of the assay value of \$4 per ton, carrying about one-

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

Price of 4-foot wide Plain Belt Frue Vanner..... \$550, f. o. b.
 " " Improved Belt Frue Vanner..... 800, f. o. b.
 " 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

CLADSTONE MINING COMPANY, C. J. Clark, M. E. Oenl. Supt.
 MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for Twelve Months. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same heating and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My report account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.
 C. J. CLARK, Oenl. Supt.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO.
 No. 132 Market Street. - - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt..... \$850 f. o. b.
 Price "Triumph" Concentrators, with Plain Belt..... \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco Cal

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

 Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

ORACE VALLEY—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrator is the equal, if not superior to any other style of Vanners or concentrating devices.
 Signed] DAVID McKAY, JR.,
 Supt. North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty (20) are now in constant use and operation.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

THE PELTON
SYSTEM OF
POWER

THE PELTON WATER WHEEL.

The most distinctively new and important development relating to hydraulic power that has been made in the last half century. Adapted to all conditions and every variety of service where a head of 20 feet or more can be obtained.

OVER 2500 IN USE, AGGREGATING NEARLY 300,000 H. P. Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 to 2000 or more feet. Much better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC POWER TRANSMISSION. The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.
121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.
148 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, varying from the fraction of 1 up to 100-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates. The great success that has attended the introduction and operation of the Pelton Water Wheel has led to many imitations and some infringements of the various patents of this company. Intending purchasers are hereby warned that all such infringements will be vigorously prosecuted, and that the users of wheels so infringing, as well as the manufacturers, will be held equally responsible.

THE GATES ORE AND ROCK BREAKER.

Unlimited in Capacity; Unequaled in efficiency. UPWARD OF 3000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without additional expense. Best and only Crusher adapted to Macadam Road Work. Send for Circular.

The Folsom Dam.

Water for Power and for Irrigation.

As long ago as 1866 the foundation was laid for a dam across the American river, at a point about two miles above Folsom and one-third of a mile above the locality where was subsequently located the Folsom State Prison. The work has been continuously in progress, either on the dam or the canal leading from it. In 1868 the State of California became interested in the work, receiving a conveyance of the site for a prison, and a grant of water-power privileges on the canal, at the said prison, in consideration of giving the aid of convict labor in the construction of the dam and canal. It was not until 1881-82 that the State commenced to furnish convict labor, and even then they stopped for awhile during certain litigation. The Folsom Water Power Co. had meantime acquired the property from the original owners and have pushed the work nearly to completion.

Additions to the dam, headgates and retaining wall of section one of the east side canal have made this work one of far greater magnitude than was at first contemplated, entailing a proportionate increase of time in construction.

The dam, headgates and section one retaining walls, down to the location of "State Power House" were, however, finally finished some months since, and are of an extent and stability scarcely equalled by any similar work in the world. For a more full understanding of these works, the following details from the Sacramento Record-Union are instructive:

The height of the dam is 89 feet, width on top 24 feet, width on bottom 87 feet, length 650 feet, masonry contents 48,590 cubic yards. The material is granite blocks of the most solid character, and of the largest dimensions, laid in the best of English Portland cement, of which 20,000 barrels were consumed in the dam and headworks.

The headgates to the east side canal are three in number, each being 16 feet wide. The headgates to the west side canal are also three in number, each 15 feet wide. The

east side canal is 50 feet wide on top, 35 feet wide on the bottom and 8 feet deep. The west side canal is 40 feet wide on top, 30 feet wide on the bottom and 6 feet deep.

The work on the State power house, situated on the State Prison grounds, at the end of section one of the east side canal, designed for the utilization of the power at

The work remaining now to be done, for the completion of section one of the canal, is the construction of the walls, gates, etc., connecting the State power house, both at the inlet and outlet, with the canal; also of a railroad bridge across the canal to give the State access to the prison yard and quarries. This work, it is expected, can be completed

a fall of 35 feet and upward, which would develop upward of 2000 effective horse power were it decided to develop the power here, temporarily, without waiting for the completion of the canal to the Folsom terminus.

It is probable that this course will be adopted, in order to furnish power to the mills and factories of the American River Land and Lumber Co., with whom the Folsom Water Power Co. has made a contract to furnish mill sites, power, etc., on its canal near the Folsom terminus.

It is contemplated, however, that most of the power will find its market in Sacramento city, transmitted there by electricity, the distance being about 20 miles in an air line.

Arrangements to this end have already been perfected whereby the Sacramento Electric Power and Light Co. will, by contract with the Folsom Water Power Co., receive a large portion of the power of the latter company; and, converting it into electricity, will transmit it to Sacramento city, there to be used for the lighting of the city and furnishing motive power for street cars, and for manufactures of all kinds.

Brilliant as are the advantages thus promised to the near future of Sacramento city and county, resultant from the development of power at the dam of the Folsom Water Power Company, they are of minor importance compared with the benefits finally to be derived from this dam, because of the general irrigation of the entire county, which it renders possible.

The dam is situated 210 feet above the level of the sea, and is therefore about 175 feet above the level of Sacramento city. The basin, or reservoir, above the dam is upward of three miles long, and has an area of 5,850,000 surface feet. The dam is fitted with a timber shutter, operated by hydraulic cylinders, and which, when closed, will raise the water six feet over this entire area, thus adding to the contents of the reservoir 35,100,000 cubic feet of water.

There is thus created a basin, or reservoir, (Continued on page 470.)

DAM, HEAD WORKS, & CANALS of the FOLSOM WATER POWER CO.,
AMERICAN RIVER, CALIFORNIA.

the "State Fall," has occupied the entire attention of the working force for the past year, and has, like the dam and headgates, proved a much larger undertaking than was calculated upon. Not until its completion can the dam and headgates be utilized for the diversion of the waters of the river, since all the water taken into the canal at the dam must pass through the wheels of the State power house, where there is a fall of 7.33 feet, yielding to the State upward of 800-horse power. The State power house proper is now practically finished, and its machinery nearly all placed therein.

in three or four months.

The fall of the American river, from the dam to the Folsom terminus of the canal, is 82 feet, and there will be upward of 70 feet of fall available at the Folsom terminus for power purposes. This will afford 7707 horse power, which, on the basis of 75 per cent actual efficiency of the water wheels, will yield 5770 horse power effective.

Power may also be developed at the end of section one immediately upon its completion. At this point the canal must be discharged back into the river during the construction of section two. There is here

Impolitic Valley Zeal.

The following is the editorial article of the *Sacramento Bee*, commenting on the recent Anti-Debris Convention held in that city:

The representatives of six leading counties touching the Sacramento river, and vitally interested in the mining debris question, in convention assembled at Sacramento, have formally outlined their position as regards hydraulic mining and the Caminetti bill, looking to the resumption thereof, and in doing so have shown a most radical spirit.

This convention was called by a number of Colusa county people, and the conditions and incidents which led up to the call and the convention's actions may be thus summarized:

The valley's position regarding hydraulic mining—i. e., that it must not be continued so long as it injured, in any way, the navigable rivers and their tributaries, or the valley lands—was very positively and definitely outlined at the recent State Miners' Convention by representatives of the valley counties, and gracefully and without restriction indorsed as the legal and just position by the miners. It was understood that this must be the basis of any proposed plan looking to a resumption of this kind of mining, and, as valley and mining papers freely commented upon the matter, he who reads could hardly have misunderstood it.

The Miners' Convention agreed that mining should stop, pending the adoption of a plan by the Government, that would keep the debris out of the streams; but, notwithstanding this agreement and the continuous efforts of the Executive Committee of the State Miners' Association to have it respected (of which the *Bee* has had convincing proof), many monitors have continued to wash the debris into the streams, and in some instances it was delegates to the Miners' Convention who directed such work, and thus broke the pledge.

The so-called Caminetti bill, now before Congress, was devised by the miners, and was claimed by them to aim at securing Government aid and supervision in devising systems of works which would permit a continuance of mining without injury to rivers and valleys. This bill, we infer, would have had the indorsement of Messrs. Ohleyer and Devlin, the valley's delegates at Washington, had there been embodied therein certain amendments suggested by them to cure certain defects which they thought might work injury to valley interests. These amendments, however, were not adopted by the miners, and the news telegrams have carried the intimation that the bill would doubtless pass in its present condition.

As a consequence of continued mining and neglect of the river, the Sacramento, for miles above and below Sacramento city, has become, within the past few months, so choked with debris as to occasion here the highest water ever known. At the same time the upper Sacramento and its tributaries were 10 and 12 feet below high water mark, the American river was not unusually swollen and the lower Sacramento was not high. In consequence, much damage has been done to farming lands in Yolo county in the past few weeks and much more was threatened in this county, and only averted by heroic efforts in guarding the levees. The navigability of the river is also threatened by the diversion of the stream into the Yolo low lands.

Such may be said to be the conditions which induced a call for the Sacramento Convention and which influenced its action.

Now, undoubtedly, it was the duty of the Convention to prominently mention in its enunciation of principles the damage that had been suffered from hydraulic mining, the fact that it was still being carried on to the detriment of river and property, and to call on the proper officials to stop it.

It was the duty of the Convention to reiterate the statement (although continually made by valley and conceded by miners) that no compromise had been effected whereby hydraulic mining was to continue to the detriment of other interests.

It was the duty of the Convention to say—what every one concedes to be true—that dams in the main streams will not keep back all the mining debris, if permitted to come down to them.

It was the duty of the Convention to state that, in its opinion, the Caminetti bill did not properly protect the valley interests, and to demand such amendments thereto as would secure the object desired.

But the Convention went beyond that, and, with a spirit of obstinacy which can work no good to the cause, absolutely declined, on numerous votes, to say what the valley has during the long antidebris fight claimed—that it had no objection to mining

so conducted as to prevent injury to other interests; it declined to state wherein the Caminetti bill was defective, and absolutely refused to withdraw its opposition, if defective or objectionable features were corrected, but demanded the absolute defeat of the bill at the hands of Congress.

The Convention had a right to conduct itself according to its own idea of what was proper courtesy to others, but we believe that its treatment of the gentlemen sent up to confer on behalf of the Executive Committee of the Miners' Association was not in good taste, to say the very least. Those representatives from the other side came from a Convention which had treated the delegates from the farming sections with distinguished and gentlemanly consideration. They came prepared to show that the Miners' Association had acted in good faith, and were empowered to make any amendments to the Caminetti bill that would cure the defects therein complained of by the valley. They met a treatment which, in the bitterest warfare, is not shown by one army to the truce-bearing representatives of the other. The Convention debated for three-quarters of an hour whether it would permit the miners' representatives to appear before it, and when consent was finally obtained it was found that the miners had done the only thing left to self-respecting representatives—they had taken the train for their homes.

The Caminetti bill, from the valley standpoint, is far from perfect, but it must be remembered that its framers claim, at least, that it is intended to permit a resumption of hydraulic mining only under the supervision of the Government engineers, and under conditions in regard to the retaining of debris before it gets into the rivers and tributaries, precisely similar to those under which certain mines have been continuously operated with the consent of the Anti-Debris Association. If a "nigger has crept into the fence," or there are defects in the bill, it would be fair and proper to point them out.

While the *Bee* has been, is, and expects always to be antihydraulic, so long as hydraulic mining does injury to any other interests, it is forced to say with regret that the action of the Sacramento convention will look to the public more like an attack on hydraulic mining itself than a protest against that portion of it which will inflict damage on the valley and the rivers. It savors enough of unfairness in spirit to cause an open rupture with the great majority of the Miners' Association who have unquestionably acted in good faith in discontinuing mining and in restraining, to the extent of their ability, their less honest colleagues. It offers an excuse for them to say: "Since the farmers are determined to crush us, and we get no thanks for abandoning our mines, we might as well hydraulic and let them stop us if they can."

It is calculated to renew all the old bitterness of the past years without accomplishing any good, which could have been more readily and pleasantly accomplished by meeting the Executive Committee of the Miners' Association with a firm but dispassionate statement of the facts and of the changes in the Caminetti bill which would make it acceptable to the valley.

Therefore does the *Bee* deplore the manner in which the convention sought to make its points, and the false light in which it has placed the antidebris fight before the public. While regretting this, the *Bee* occupies the position that it has held for 20 years—it opposes hydraulic mining so long as it injures other interests; it will be pleased to see it resumed only if it can be prosecuted under Government supervision and without injury to rivers and valleys; and in the interests of the State, it will lend its aid at any time to such a consummation.

GERMAN MINERS.—The Government Mine Council (*Oberbergamt*) of Bonn has arranged that the men employed in the Royal mines of Saarbruck shall be represented by delegates regularly elected and called *Vertrauensmänner*, or "men of trust." Mine owners in the district have hitherto repudiated all idea of the miners being represented and having a voice; but the Prussian government, after the strike of 1889, considered it necessary to ameliorate the condition of the men by giving them a *locus standi*. This new measure will permit the miners to make known their views and grievances to the Government Mine Direction, and to express an opinion as to the labor question to the colliery managers. All miners 21 years old, and having worked 3 years, have a vote, and miners 25 years old, having worked 5 years, are eligible as delegates. Every district of a mine in charge of a master miner nominates a delegate, who must belong to the district. The delegates, elected for 2 years, and eligible for reelection, have the mission to (1) discuss with the manager the

wishes and grievances of the men, (2) the conditions of contract between master and man, especially as regards hours of work, (3) make known to the managers the state of well-being of the miners and their families, (4) promote a good understanding among the men, and (5) the observance of their part of the contract, as well as attention to measures for furthering safety and hygiene.

At Harshaw and Washington, Arizona.

"F. B. L." writes to the *Tucson Citizen* of these camps as follows:

During a day's sojourn at Harshaw last week, I noted a few facts which may prove of public interest. The World's Fair mine, merely a prospect one year ago, is one of the most prominent in the camp, coming up to the full measure of expectation on the part of its fortunate owner, Frank Powers. The main shaft is now 90 feet deep, and a tunnel 116 feet in length to connect therewith is being run, and lacks but 10 feet of completion. The first shipment, three months ago, yielded Mr. Powers over \$5000, since which he has made other shipments of smaller lots.

Chas. Powers, G. F. Spencer, J. W. Hubbard and Tom Davies are about to commence on another Hermosa lease. The Hermosa mill has been temporarily closed down awaiting an accumulation of ore. This mill is owned by the veteran miner, James Finley, who is also proprietor of the great mine of the same name, Frank Fitzsimmons manager.

A. J. Matney and R. E. Lee have also a lease on the Hermosa. Wm. Gittens and Charley Hudson are working the Salvador under lease and making some money.

Marrington, Tom Ellis and Capt. Alva-berg have a lease on the January, one of the oldest and best mines in the district. A recent shipment assayed 60 ounces silver and 50 per cent lead.

The Harshaw Silver Club claims a membership of about 100.

There are enormous quantities of ore in this district, which, however, is of too low grade for profitable shipment or for milling on the ground at the present low price of silver. When the tide, which is now against the great silver mining industry, is turned, once more Harshaw is certain to become a booming camp and will last for many years.

There seems to be general opposition here, as in all mining sections I have visited, to the theory of assessing unpatented claims. The validity is not only seriously questioned, but will doubtless be tested in the courts should the tax gatherer attempt to levy for this purpose.

Mining matters are progressing quietly at the Old Mowry, while at Washington Camp, ten miles above Harshaw, I was informed the outlook is better than for some years past. The Holland, which was opened last year by York & Co., is now being worked by a force under C. H. Taylor, employing a bundle and jigs, to which Mr. Taylor has added an improvement by which it is claimed he can do the work on a larger scale and more successfully with a given amount of labor than formerly. It is reported that Roy & Titcomb of Nogales, and others, are interested in the mine, and that a stock company will be organized by them in the near future to operate it.

Since the collapse of the Duquesne Co., three years ago, very little has been done at Washington till recently. The concentrating and milling plant started by this company was never completed. One year ago, however, through the intermediation of D. Bauman and G. H. Brooks, a market was opened up for the refractory ores of the camp. From 150 to 200 tons of shipping ore are now being extracted monthly, whereas this quantity, it is said, may easily be taken out daily, so abundant is it and comparatively easy of access. The ore is sulphide of lead, copper, zinc and some iron, with from 20 to 35 ounces silver. A fair average of the latter ranges from 26 to 30 ounces. The haul to Crittenden costs \$7 per ton freight; to Colorado, \$8, and treatment charge from \$10 to \$11. This is the most prominent ore in the camp. There are also large bodies of similar ore with more rocky matter, requiring concentration for shipment. Another shipping ore is an oxide of zinc, lead and copper, running from 12 to 14 per cent lead, the same in copper, a little zinc and 25 per cent silver. Then there is oxide of copper carrying from 20 to 30 per cent silver. The Belmont, about the oldest patented mine in Arizona, provides a siliceous red ore, carbonate of galena and oxide, running from 20 to 60 per cent lead and 20 to 110 ounces silver, making it a profitable shipping ore, even at the high price of transportation and low price of materials. The names of the shipping mines are the Hol-

land, Pride of the West, Silver Bell and Belmont. A few others make occasional shipments. D. Bauman, manager of the Belmont, told me that Washington district shows as massive ore bodies as even did Leadville, but that the great bulk of the mineral requires concentration at the camp. Experiments, as well as actual work, now carried on with the aid of some of the machinery of the old Duquesne Co., demonstrate that the lead sulphide in the ores carries most of the silver, and will readily concentrate into a 100-ounce product.

In view of the facts stated above, the query might arise, why has this camp not come to the front long ago? To which the reply is easily given that the Cameron grant cloud has rested over the property all these years, and capitalists are loth to develop mines under such circumstances. The stockholders of the Belmont secured an agreement with the grant claimants of non-molestation. All, with this exception, is under the cloud. The prospect is now good, however, that the title will soon be settled; and be it either for or against the grant, the final decision can scarcely result other than favorable to the development of a great mining camp.

The Anti-Debris Resolutions.

The following resolutions were adopted by the Anti-Debris Convention at the recent session in Sacramento:

The people of the Sacramento valley, affected by the results of hydraulic mining on the watersheds of the navigable rivers and their tributaries, in convention assembled, recognizing that the position of the valley has not been correctly represented, do now declare:

First—That the navigable rivers have been almost irreparably injured by hydraulic mining, vast bodies of fertile land adjacent to the streams have been irretrievably ruined, and the prosperity of the valley and its towns and cities has been retarded by the constant fear that their rivers would be filled up by the vast deposits therein of mining debris.

Second—That at no time have the people of the valley consented to the continuance of hydraulic mining, but on the contrary have expended vast sums of money to protect their homes and the navigability of the rivers.

Third—That no concessions have been made or will be made whereby hydraulic mining may be resumed to the detriment of the rivers or the adjacent lands.

Fourth—That, contrary to the law as declared by the courts, various persons continue to mine by the hydraulic process and to dump their tailings into the streams.

Fifth—That we do urgently request the Attorney-General of the United States and the United States District Attorney of the Northern District of California to commence immediately proper proceedings, in the name of the Government, to prevent hydraulic mining to the injury of the navigable rivers of California, and to enforce the laws and decrees provided for their protection.

Sixth—Inasmuch as it has been stated that the people of the valley favor or have no objection to the erection of dams in the navigable rivers of California or their tributaries, for the purpose of permitting the resumption of hydraulic mining, and in the belief that they will be effectual for that purpose, we solemnly declare that such dams will not restrain the debris and suspensory matter that has done so much damage in the past, and are unalterably opposed to the erection of dams for the further prosecution of hydraulic mining. We deny that the engineers of the United States have reported that the erection of dams will restrain the matter that has injured the rivers, and, as proof of this assertion, quote their own language, viz.: "These dams, however, will not be effective in impounding all the material delivered into the canyons from the mines. Being in the streams and in the pathway of the freshets, portions of the heavier material will be carried over the crests of the dams, to eventually find lodgment in the river below. The finer sands and clay cannot be effectually impounded by such barriers, but will be carried off in suspension."

Seventh—The bill recently introduced in Congress by Hon. A. Caminetti is in effect a license for the resumption of hydraulic mining by the United States Government and a rehabilitation of a system of mining placed under the ban by the courts, and suited only to an uninhabitable country, and we are unalterably opposed to its passage, and demand of our Senators and Representatives in Congress that they use every effort to secure its defeat.

Resolved, That an Executive Committee be appointed by the Chair, to consist of fifteen members, including the Chairman of this convention, who shall have full power to take such action as they may deem proper for carrying out the purposes of this convention.

Resolved, That we pledge ourselves anew to resist, with all the power at our command, every and any act and attempt to rehabilitate hydraulic mining on the Sacramento and San Joaquin rivers and their tributaries, to the injury of the rivers and the valleys, and would recommend to the several Boards of Supervisors of the river counties the formation of a State antidebris organization, for the purpose of enforcing the laws and decrees promulgated for our protection; and to that end.

Resolved, That the members of the Boards of Supervisors of the various counties embraced in the call for this convention be requested to meet at Sacramento on the 6th day of August, 1892, at 10 o'clock A. M., for the purpose of consulting and consolidating their efforts in preventing hydraulic mining.

A WALL-PAPER COMBINATION has been formed at New York, and it is expected that a production of 12,000,000 rolls per annum will be obtained.

The Southern Pacific Shops.

The Great Industrial Works at Sacramento.

The Southern Pacific car shops, located at Sacramento, are the largest and most complete in the United States, save those at Altoona, Pennsylvania, and are fully equipped for the manufacture of every item of railroad equipment, either of track, train or motive power, except the making of rails. About 2000 men find constant employment in them, the number frequently going even higher during the busier seasons. Complete locomotives are turned out at the works, among them some of the largest in use on the continent, and probably in the world, and most of the cars in use upon the company's great system are built here.

In a recent number of the *Sacramento Bee* appears a description of these shops. Some idea of the necessity of employing so large a force in the shops and yards may be gained from a statement of the amount of rolling stock in use on the Pacific system of the Southern Pacific, which includes all its lines in California, Arizona, New Mexico, to Ashland in Oregon, Nevada and Utah. There were last summer 737 locomotives in use, including those of the narrow gauge coast road and the six new switch engines just added. There are 80 first-class Pullman sleepers, 900 other passenger train cars, 14,441 freight cars and 340 miscellaneous, including derrick cars, pile drivers, etc. In addition to this rolling stock the company has 17 steamers, 1 steam barge and 3 other barges, plying in the river or the bay as ferry boats, for all of which the main repair work is done here, except in such cases as it is necessary for the boats to go into dock. Besides this rolling stock and steamboat machinery to be kept in repair, so far as the heavier work is concerned, track work, which includes the cutting of rails for split switches, tank and pump work, manufacture of switch stands, etc., is done here. At various other points the company has small repair plants established, but no manufacturing is done except in Sacramento.

THE VARIOUS DEPARTMENT HEADS.

The shops and yards cover an area of about 30 acres, and are divided into various departments, all under the general direction of H. J. Small, Master of Motive Power and Mechanical Department. T. W. Heintzelman is Master Mechanic, and E. M. Luckett, general foreman. Each department is, of course, under its distinct foreman, who are as follows: J. W. Clark, round house; John H. Andrews, machine shop No. 1, and J. G. Camp, machine shop No. 2; Stephen Uren, blacksmith shop; M. A. Baxter, foundry; J. M. Dunigan, boiler shops; Gustav Blauman, copper shops; John Boyd, rolling mill; A. J. Gardiner, pipe shop; E. B. Osler, brass foundry; Benjamin Welch, car construction; Phil Douglas, car repairer, and A. Becker, the yards.

THE ROUND HOUSE.

The round house has 28 stalls, but this number is hardly found adequate to the demand, for there are 80 locomotives in and out per day, and as there are always some which require to lay over for a time for repair, Mr. Clark frequently finds himself pressed for room. On the occasion of a recent visit of a *Bee* reporter to the shops, some monster locomotives were standing in the stalls. The largest was No. 267, a 12-wheeled engine, with 20x26 cylinder and weighing 139,000 pounds. There are 25 engines of nearly similar dimensions, built expressly to run over the Sierra Nevadas on the Central Pacific and the Tehachapi mountains on the Southern Pacific.

THE BOILER SHOPS.

South of the round house is the boiler shop, where as high as 200 men are sometimes employed. The shop is 80x240 feet in dimensions, and is well lighted and ventilated. Boilers for both locomotives and steamboats are made here complete. Any kind of work up to half-inch steel plate can be done. The machinery in this shop is interesting to the spectator because of its power. The planer will bevel the edges of a half-inch steel plate like a carpenter's plane will edge a pine board, the punches put the holes through with as much apparent ease as a sewing machine needle penetrates a piece of cambric, while the shears cut a three-quarter inch steel plate as tirelessly as a country editor gets out his copy.

THE MACHINE SHOPS.

The machine shops occupy the central building of the entire plant, and are in a vast building 100x500 feet in dimensions. In this great room are (two divisions, known as machine shops No. 1 and No. 2. The former is in the northern end of the building

and is where the locomotive repairing is principally done.

Everything here is maintained on the most perfect system. When an engine comes in for repairs, each part of it is looked over by expert machinists. The boiler-maker examines the boiler, the coppersmith inspects the fittings, the pipe fitter goes carefully over the work of his department, and so on. Each makes an estimate of the probable cost of the repairs, which estimates are submitted to the master of the motive department. If it should happen that the cost of repairing is greater than is justified, the locomotive is condemned and run into the "bone-yard," where it is torn to pieces and the cast iron parts sent to the foundry, the wrought iron to the rolling mill, and the brass and copper work to the brass foundry or copper shops. All material that can possibly be worked over is made to do continuous duty, and all the metallic part of an engine, save the steel parts, is recast or worked over in the forges. For the steel parts there are no appliances for working over again here, and the discarded material is disposed of to foundries in San Francisco which make a specialty of such work.

MACHINE SHOP NO. 2.

Is the most interesting of any department of the great plant from the variety of the work done. While No. 1 is devoted to locomotive work, No. 2 does principally track work, and does the repairs for all other departments. Included in the track work is the cutting of rails for switches, the setting of switch stands, the manufacture of pumps, either hand, steam or run by wind-mill, the iron work for water tanks, and, in fact, all work not directly connected with the locomotives. They also build here all the stationary engines, the steamboat engines and iron bridges. The engines of the ferry steamer Piedmont, which plies between Oakland and San Francisco, were constructed here about nine years ago.

It is in this shop that the planing of all the heavy castings and cylinders is done, and the driving wheels of the engines returned and beveled.

THE FOUNDRY.

The foundry occupies a corrugated iron building, 100x400 feet, in the southeastern corner of the yards. It also is composed of two divisions, one being for the casting of the almost infinite variety of forms needed, and the other devoted exclusively to car-wheel making. Each division is complete within itself, having its separate cupolas or melting furnaces, cranes, elevators, etc. There is scarcely a limit to the size of the castings that may be made in the general foundry. The largest that has ever been made was of 30 tons weight. From 18 to 20 tons of iron are now used daily in this division of the foundry in the proportion of about one-quarter of pig iron to three-quarters of old stock.

MANUFACTURE OF CAR WHEELS.

In the car-wheel department there were, at the time of the *Bee* reporter's visit, 40 men employed and 122 car wheels turned out daily. The men work in pairs—a molder and a helper—and each set will make 13 wheels per day. An average day's work for each gang is 11 wheels.

Car wheels are made for the entire system and all its branch roads and for the street railway lines owned by the Southern Pacific Company in San Francisco.

There are used daily about 36 tons of iron and 11,000 pounds of fuel, about 35 per cent of new iron being used to 65 per cent of old wheels. Eighty-five old wheels are broken up each day to be used for the charge. This division is equipped with six hydraulic cranes and an overhead tramway, which carries the ladles of melted iron to any crane desired, for every possible device is used to relieve the men from heavy lifting, and there is practically none of it to do.

THE BLACKSMITH SHOP.

No part of the Southern Pacific's machine shops is more interesting than the blacksmith shop and rolling mill. The principal features of the blacksmith shop are the immense hammers, of which there is one 500-pound steam hammer, three power hammers, two steam hammers made in the shops, one 2500 pound steam hammer, the Sturtevant blowers, two reverberatory furnaces, two large power punches, two pairs of power shears, one engine with 12x16 cylinder, developing 500 horse power, 65 forges and 10 cranes. Here is done all the forging for every department in the railroad system, including all the wrought iron work for the construction of new cars and locomotives, the manufactured articles being shipped to the different divisions of the system as they may be needed. Of the single article of carlinks and pins, 30,000 to 40,000 are manufactured annually.

All the large forgings are shaped out

roughly under the steam hammer before being sent to the forges. There is no new iron used, all being old scrap iron. Much of this is obtained from Europe, ships bringing it as ballast.

Two furnaces and a steam hammer are used for making car axles. This plant has been recently put in and has an output of from 35 to 40 axles daily, weighing about ten tons.

There are from eight to ten tons of iron used daily in the manufacture of bolts, nuts, spikes and rivets. All the bolts and nuts are taken to the machine shop to have the threads cut.

ROLLING MILLS.

In the rolling mills there are three trains of rolls, No. 1 turning out all sizes of iron, from three-eighths of an inch to an inch, round and square, about 16 tons being used daily. Nos. 2 and 3 roll all sizes of flat iron, from one-fourth of an inch to two inches in thickness, and from three-fourths of an inch to nine inches in width. It is here that all shapes are made for bridge and car constructions, also fish plates and all sizes of angles. The output is from 25 to 30 tons daily.

The total amount of iron produced in the rolling mill, from the commencement of operations to 1890, was 92,383,865 pounds, the first rolling being done in 1837.

SPRING SHOPS.

The spring shop is an important feature of the plant, as the springs made here are claimed to be vastly superior to those of Eastern make, the superiority of the Southern Pacific spring being twofold, consisting of difference in shape of the end of the main leaf, which gives greater elasticity, and in a finer tempering than is received by the Eastern spring. By reason of these improvements, a driver spring of the latter make, with 15 leaves and weighing 140 pounds, is replaced by one with ten leaves and weighing but 96 pounds, and a truck spring of 18 leaves, weighing 200 pounds, by one of 15 leaves weighing 135 pounds. Several of the important machines in use in this shop are the invention of George H. Smith, the foreman, as also the tempering fluid in use.

BRASS FOUNDRY.

The brass foundry occupies a portion of the same building in which the spring shop is located. About 6000 pounds of castings per day can be made. Brass, properly speaking, is composed of copper and zinc, but in the work here, to these ingredients are added lead and tin. Old material is used, but about 10,000 pounds of new copper per month are required. From 25 to 30 tons of castings per month are now being made. For bronze castings, copper, tin, lead and phosphorus are mingled. The foundry is one of the best-equipped on the coast, and some very fine work is turned out.

COPPER AND SHEET-IRON WORK.

The copper shop usually employs from 25 to 30 men. Though called the copper shop, all the work is done here in sheet copper, iron and tin. It is the only shop on the system, and all new manufactures, therefore, come from it, though one or two men are kept at the branch shops for repair work. It is also the supply depot for sheet metal, wire and pipe, and, if any such is required elsewhere, a requisition is made on this shop for it. About \$20,000 worth of material is kept in stock. The copper pipe is not made here, but is kept in stock of from one-eighth of an inch in diameter to seven inches. Like all the other departments, this shop is well equipped for all its purposes, and most of its equipments were manufactured at home.

THE CAR-BUILDING SECTION.

The car-building departments are as correspondingly extensive and complete in all their details as the sections previously described, which may well be realized when it is known that all the cars of the system, including passenger coaches, flat, box and combination freight cars, are manufactured here and the greater portion of the repairing also done. Pullman sleepers are purchased from the Eastern manufactory, but all rebuilding comes to the shops in this city. The shops have numerous subdivisions, each under a competent foreman, and nearly one thousand men are employed.

It is hard to estimate the capacity of the car shops, as they have never been pushed to their fullest capacity. Last season there were constructed 25 narrow gauge box cars, 200 flat cars and more than 300 combination cars. An immense quantity of lumber is used annually, probably an average of 4,000,000 feet, but in 1888 the total amount consumed in construction and repairs was 7,460,000 feet.

SOME MINOR DEPARTMENTS.

In this department are included, in addition

to the main car-building shops, the pattern shop, the planing mill, the cabinet shop, upholstering room, dyeing room, upholstering storeroom and sleeping-car equipment room.

There are several smaller departments that space forbids more than mere mention of, such as tin, air-brake and paint shops, etc.

THE REPAIR SHOPS.

Among the most important departments of the great establishment is the repair shop, of which Phil Douglas is foreman. It is located in a room 200x60 feet, and to it are brought for repairs all damaged cars on this portion of the system. Mr. Douglas inspects the cars as well as supervises their repairing, does the babbitting for the whole road, and has charge of the wrecking crew on this division.

A general supply store and shipping department, including all kinds and classes of car material, is maintained.

All the various shops and the yards are kept in the most perfect order, and the utmost cleanliness pervades every department. All possible arrangements for the comfort of the men are provided.

A well-equipped fire brigade has been established, and water is conducted to every part of the yards, so that the danger from fire is reduced to the minimum.

IMPROVED MACHINERY.

Many of the most perfect-working and completely labor-saving devices in use are the inventions of mechanics in the shops, and there are almost innumerable improvements in track and train. Railroad men from the East who visit the great plant in this city are amazed that, away off here—where it is not to be supposed that Eastern improvements would so quickly reach—the necessity, which is the mother of invention, has led to more and greater improvements than can be found upon any system elsewhere in the country.

IMPROVEMENTS PROPOSED.

But extensive as the shops are, and perfect in equipment, they are scarcely adequate to all demands. A necessity for their enlargement already exists. But, fortunately, the company, years ago, foresaw the possibility of such an emergency, and it is announced that shortly the filling up of China slough will be begun. When this work is completed, and the extensions and additions contemplated carried, the Southern Pacific's plant in Sacramento will possibly be the most extensive railroad shops in the United States. Supt. Small stated recently to a *Bee* reporter that hereafter there would probably be 500 or 600 new cars built here annually, as it was the intention of the company to gradually retire all the old-style and small cars and replace them with others of a larger and improved pattern.

THE DEEPEST COLLIERY IN THE WORLD.

While the average depth of French collieries is 1073 feet, that of the coal mines in the Hainault district of Belgium is 1800 feet. In the Mons coal basin the mineral is at present being obtained 3036 feet beneath the surface, and another colliery in the same basin, now abandoned, was worked to a depth of 3860 feet. In April last year, in a mine in the Fleny district, called "St. Henriette des Produits," a rich vein of coal was struck at the extraordinary depth of 4186 feet. This is beyond doubt the greatest depth at which coal has ever been obtained, and, indeed, at which any mineral has been extracted, as the deepest mine in the world is understood to be the rock-salt bore at Spensenberg, near Berlin, which yields the saline product at a depth of 4175 feet. The shaft is not, however, perpendicular, the honor of possessing the deepest absolutely vertical shaft having been claimed by the now disused Kuttenberg mine, in Bohemia, which was exploited to a depth of 3778 feet. The deepest British mine, it is known, is the Ashton Moss colliery, 3150 feet. But the deepest nonmineral sinkings are in America. They are an artesian well at Potsdam, Missouri, and a well which was drilled at Wheeling, W. Va., last year, in a search for petroleum or natural gas. Both these borings attained a depth of over one mile.—Iron.

SMOKE SUPPRESSION.—A test of the combined apparatus of two English inventors for the suppression of the smoke nuisance was recently tried in London. One invention consists of fire-clay arches through which the gases and air are passed. These becoming incandescent, the smoke is consumed. The other invention consists in the introduction of low-pressure currents of air by means of steam jets. The two devices combined are said to have produced excellent results.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

CLINTON.—Amador Record, June 16: At the Clinton Consolidated, of Wieland, the front ledge has been opened up. The walls are well defined, and next to the foot is a two-foot gouge carrying an assay of \$3 to the ton, while next to the hanging wall there is a vein of fine ribbon rock. The company will no doubt feel greatly encouraged at finding such flattering prospects in the new quarter. At the Belmont mine, work is progressing most favorably in the Boss shaft. Superintendent Tibbits left for San Francisco last Sunday, and while absent he expects to arrange for placing an engine over the shaft so that work can be carried on to a greater depth. W. G. Worf arrived here last Saturday and went over to take charge of the Goodman mine, adjoining Quartz Mountain. He will put on several miners at once and proceed with active work.

SUTTER CREEK.—Cor. Amador Ledger, June 17: Mining continues to improve gradually. Lowering the water at the Hector is progressing. Mr. Valentine states that they have reached the 500-foot level, that the shaft is in very good condition and they hope to continue right along without any serious delay. At the South Eureka things are looking more encouraging. They are in about 100 feet east from the shaft, and the ground is getting softer and quartz is coming in quite plentifully. The west looks still more favorable. They have reached a distance of about 50 feet, and the ground is so loose that timbering is required to make it safe, and quartz is steadily increasing. It appears that north of them for a considerable distance the ledge is divided by what is commonly known by miners as a horse, which makes it certain they have a ledge on the east and west, how far from the shaft is a matter of conjecture, but according to the course already traced both will soon be reached. At the Wildman everything is running like clockwork. The rock is said to be of paying character, and the mill is running at its full capacity.

NEW YORK MINE.—Amador Ledger, June 17: This week we paid a visit to this mine, situated in John Bull diggings, 2½ miles west of Jackson. This property has been held by W. G. Anderson and co-owners for over 15 years, and more or less work has been done each year. We were surprised at the vast amount of work that has been done. One tunnel has been driven 900 feet due west, cutting three distinct quartz ledges. Above the end of this tunnel a vast surface excavation has been made, the formation being porphyry mixed with small seams of quartz. From this point the Huntington roller quartz mill was kept running for months last winter, with what result in bullion yield we are unable to say. This point is over 1000 feet from the mill. Immediately above the mill, however, another tunnel has been run 200 feet, encountering a vast body of quartz. From the tunnel a winze has been sunk 50 feet, in quartz all the way. The mill is excellently fitted up. It is one of the heaviest roller mills, and crushes 25 to 30 tons per day; provided with a rock breaker and every convenience for economical working. All the machinery, including the hoist at the end of the tunnel, is run by water power and by the same water wheel. The water is free, being taken up from Jackson creek by ditches two or three miles in length, owned by the company. Of the paying character of the quartz, we are unable to give an opinion. The ore is different from that met with on the main belt. It carries a small percentage of sulphurets, and we were shown samples showing free gold. The ore is low grade, but the facilities for working it at little expense are unusually good. Everything is idle at present. Nothing has been done for two months. This idleness is on account of some of the stockholders being backward in putting up their share of the expense of putting up the mill and other machinery. Over \$12,000 was spent last year in these improvements. When these financial matters are adjusted, the mill will resume operations. Mr. Anderson has unbounded confidence in the value of the property. The surface shows that the locality was the scene of extensive gravel-mining operations in early days.

KENNEDY.—The sinking of the north shaft has been suspended temporarily, on account of the heavy flow of water. It will be resumed and the shaft sunk to the same depth as the south shaft, as soon as practicable. The mine is looking well. The New York mining papers credit the Kennedy with having paid 30 cents per share in dividends since January last. This is a long way below the mark. The stock belonging to the estate of L. McLaine, consisting of 1000 shares, was sold for \$9000, or \$9 per share, to H. J. Crocker. The shares have sold as high as \$15, but this was considered an extreme value, even when the dividends were from 30 to 40 cents per share per month.

AMADOR GOLD MINE.—James E. Dye paid the taxes on this property last Wednesday, the money being forwarded from London. It is definitely stated that the matter in dispute between the American and English stockowners will be settled finally in a few days. It is to be hoped that this latest rumor may prove correct. So many rumors of expected settlement of the troubles have been circulated that people pay little heed to reports of this nature.

Calaveras.

AT ANOELS.—Cor. Sacramento Record-Union, June 22: At Angels camp, Hayward, Hobart & Lane have been so greatly encouraged by the continually increasing width of the ledge as they go down in the Utica mine that they are

operating others in the vicinity, and are bonding and prospecting still more. They already have a ditch from Murphys large enough to work their present mines, and are talking of bringing electric power to work the Madison mine should developments prove satisfactory. Residents of Murphys told me that the stream above that point has a flow of 5000 inches or upward and a fall of 500 feet. If that is correct, its use means 22,500 theoretical horse power at the fall and 15,000 that could be made available at the mother lode by late discoveries in electric transmission. Four horse power per stamp is as much as the average mill uses for crushing, pumping, hoisting and air-compressing. About half way from Angels to Murphys the present ditch has sufficient fall, that is not used for motive power, to be available for the Madison mine, and some to spare, without going all the way to Murphys to locate an electric plant. If the power available at Murphys should be used to develop mines along the mother lode, with ten per cent the cost of steam power, that Mr. Call finds practical as the result of his work at the Gower mine, it will mean the profitable working of many mines now idle and the opening of many prospects not available by present methods. As the company owning this water has grown up in the mining business from small beginnings to several of the largest operations on the coast, and their policy is to work mines with their private capital so long as they pay, and then move improvements to other places, I look for an immense development in their operations about Angels. They are able to avail themselves of that water power, and when once available, there is little to prevent their working low-grade ores from lower levels at a less cost than almost any place in the country. Mr. Lsne, the resident partner and manager, informed me, quite significantly, that they generally made the Utica yield enough to pay the men, and I gathered from the outside that the mine probably produced in the neighborhood of a million a year. Yet this mine laid idle for many long years in the hands of men who were unable to invest the capital necessary to make it productive. On one side of the county flows the Mokelumne and on the other the Stanislaus, both capable of supplying practically unlimited power, that can now easily be transferred by electricity to points needed. Previous developments make it reasonable to suppose that many another Utica will be opened along the lode as soon as men of capital, nerve and experience are attracted to the advantages awaiting them. At Mokelumne Hill extensive prospecting is going on in the direction of boring for the ancient river channels. Developments are reported very encouraging. As the mines have paid well near the surface, and no one has sunk below 200 feet in that vicinity, it is reasonable to suppose that the lower levels are worth prospecting.

Humboldt.

DISCOVERY OF COAL.—Western Watchman, June 18: Stanley Stevens writes from Ferndale that there has been a discovery of coal on Williams creek, about two miles from Ferndale on the place of Joseph Steves. The vein is eight inches thick on top and widens as they go down. It is pronounced by experts to be A 1 coal. Another report comes of the discovery of coal near Arcata, specimens of which are at the office of G. H. Close. Humboldt is destined to be "in it" somehow. Coal, iron, petroleum are all on the verge of development, which, added to the other great sources of wealth which she possesses, will wake things before long.

Nevada.

STEEP HOLLOW.—Cor. Tidings, June 17: Your correspondent recently visited Hussey's quartz mine at Steep Hollow. Six men are employed. The mill is in charge of Mr. Hogan of Washington. Mr. Hussey says that the mine has paid expenses so far, and the ledge looks more promising. A. B. Everett has returned from Ohio, and is ready to commence work on the Banner mine, in which his son-in-law is heavily interested. The Banner is in the vicinity of Gray's mine, at Fool's Flat. Mr. Foss still has men pushing his tunnel ahead toward Steep Hollow. Jos. M. Blaine is still prospecting his mine on the north fork of Steep Hollow.

MINING AT ROUGH AND READY.—Grass Valley Telegraph, June 17: Around and about Rough and Ready there is considerable mining going on in many ways, including prospecting for quartz and gravel. Much work is being done in the way of picking over the old bedrock that had been washed over and over years ago. As a result of the latter, we saw to-day something like \$300 or \$400 in coarse gravel gold brought to town by Henry Schroeder. The gold was ranging from the size of a large bean up to as large as a man's thumb. One piece shown was just about the size and shape of a man's jaw. All of the gold was very high as to fineness. The nuggets came from different places around the old bedrock lying exposed around Rough and Ready. Mr. Schroeder says also that yesterday several young men were prospecting around what is known as the old Brown diggings on Squirrel creek, back of Rough and Ready. They came across some old decomposed quartz sticking out of the bedrock, and from six pans full of the dirt they took over \$40 in pure gold.

JEFFERSON MINE.—The Jefferson mining location, which is the first western extension of the Osborne Hill mine, and which has been owned by John B. Conlon for many years, has been sold to San Francisco parties, and the first payment made upon it. The purchasers will proceed at once to put up steam hoisting works and sink a shaft on the property.

ROCKY BAR MINE.—A cleannp of a crushing of quartz from the Rocky Bar mine was made at Southern's mill on Tuesday, which turned out finely. There were 45 loads of quartz, which yielded \$65 per load, or an aggregate of

\$2925. The cleannps from the Rocky Bar always give good results.

W. Y. O. D. DIVIDEND.—The W. Y. O. D. Company has declared a dividend (No. 10) of 10 cents per share, amounting to \$3000, making the total of all dividends declared \$24,000.

DELHI.—Nevada City Herald, June 18: At the Delhi, the work of putting in heavy machinery is about to commence. The company are considering a proposition to put in electric power, the only drawback to which is the great power required for pumping. The pumps at the Delhi have to raise 64 inches of water constantly. The new plant will have two ten-inch pumps.

A DIVIDEND.—The Champion has declared a dividend of ten cents per share. This is the result of 15 days' run.

THE OGIN.—Nevada Herald, June 17: At the Ogin, the south drift is being pushed rapidly ahead. Three shifts are worked, about 15 men in all, under the supervision of Carl Hesse. The drift is 20 feet below bedrock, and borings are made occasionally in the top to let the water run out of the old workings overhead, there being acres of ground worked out in the hillsides. The drifters are now blasting through an immense boulder, an unusual thing to find below the bedrock. The drift is intended to tap a bed of gravel left there years ago untouched, and it is expected to reach it in about six weeks.

THREE GOON PROSPECTS.—Eureka Sentinel, June 17: Recently there has been marked improvement in three of the mines of this district. Jas. McBriney and John Berryman have a splendid showing in the north end of the Antelope claim, owned by the Diamond company. They have a lease at that point, on which they have been working for several months. Lately they broke into a cave which promises to yield a large amount of high-grade ore. An important development has also been made in the Alexandria mine, which is under lease to Hartnett and Fraser. They have just cut a very strong feeder of excellent ore. Out on Adams Hill, the men employed in Charlie Wallace's mine have drifted into a face of ore which gives promise of being large and valuable. Nick Barlow, who is working there, gives it as his opinion on that the prospects are first class for a paying bonanza. We are glad to note these several improvements, as it shows that the days of important strikes are not yet over in our district. Eureka, with capital for prospecting, is one of the best mineral sections in the whole mining world.

Plumas.

THE DAURY.—Plumas National, June 9: The mining interest seem to be improving. Standard & McGill have started their mill on ore from the Drury mine. Fifteen stamps are running on good ore, of which a large quantity is developed in the mine. The Johnny Bull mine and mill are being operated, and the outlook of that property has improved very much. D. McIntyre is getting the lumber on the ground at Wolf Creek, to build a 10 stamp quartz mill to crush ore from the Hidden treasure, which he and Archie Warren have been developing during the past three years. In the same locality, Standart & Thompson will soon begin driving a 300-foot tunnel, to tap the back channel of gravel. They report good prospects to begin with. Judge Emmons has resumed the extraction of ore from his mine at Cherokee, and, in a few days, will begin crushing it at the Acadia mill, below the Round Valley reservoir. Good ore is reported in this mine.

CRESCENT.—Work at Crescent proceeds with the usual regularity. The new hoisting-works present a very substantial appearance. From the bottom of the shaft, drifting toward the vein is progressing rapidly. At Green Mountain, all the buildings have been put in first-class order. It presents a very imposing appearance. The work underground continues, and the mill will resume crushing in a few days. Joseph Grus continues work in the Genesee mine with varying success. Sometimes he has very rich ore.

Tuolumne.

NOTES.—Independent, June 17: It is said that Dixon & Mawr took out a pocket of \$200 on Nolan's ranch about two weeks ago. The Ham & Burney mine, near Columbia, will shortly be reopened by the Leechman Prospecting Co. George Mapes has put up a small mill at his Shanghai mine at Yankee Hill, and will shortly commence crushing. Warner, Digley, Woodside and Endicott, of the Noonday mine, have their mill about ready for work. They have considerable rich ore in the bin. Some parties are mining opposite the Keltz mine, and have recently struck good ore. They will pack it on burros to Riverside mill to crush. Victor Guist and partner are prospecting near the Keltz mine, and have found some rich float rock. The soil is deep, but they hope soon to locate the vein. Several good prospects have recently been found in the vicinity of the Noonday. The richness of the latter mine induced prospectors to look into the matter. The Little Gem mine, south of town, has been bonded to J. F. O'Gorman, and water is now being pumped out of the shaft preparatory to the commencement of other work. J. F. Bluet intends shortly to recommence work on the Old Riverside claim, about ten miles above Columbia. It is low-grade ore of large body. It runs all the way from \$1 to \$10 per ton. A young man who has been pocket-mining in the edge of town, last week, found a pocket said to be worth about \$1500. He found \$2000 on the same vein once before. He would not consent to have his name published. John O'Hara is cleaning out the old Rother claim, on Bald mountain, and will work it for all it is worth. Rother knows how to find it. He has mined on the hill for many years, and has taken out several pockets—one of \$6000. We were shown a piece of ore this week from the Otto Kanig mine, which is situated on Bret Harte's "Ra-

ging Stanislaus." The specimen was a sort of decayed quartz and full of free gold. Several Columbia parties are interested in the mine. The Keltz mine is now running in full blast. New claims have been put in the mill. They have a very fine chute of ore, both large and rich. They recently put in a Dodd wheel, and report that whereas they formerly used 17 inches of water, they now do the same work with 104 inches. The Bonanza Mining Co. is having over 3000 feet of pipe laid, with which to bring water to the mine from the Street ditch. Part of the pipe will be 11-inch and part 6-inch. The water will be used for power with which to operate pumps, air compressors, etc. A gentleman has been tunneling under a table mountain in a quiet little nook for about four years past, and found the pay gravel of the ancient river bed shortly after commencing work. He has been taking out considerable gold for several years, and now lives like a prince. He keeps that matter very quiet, and very few know who he is or where his mine is. Wm. Sharwood commenced recently to prospect a mine at Cherokee called the Porto Fino. He has got into a vein varying from six to ten inches in width, and running from \$60 to \$70 per ton. He will haul the ore to the mill at Soulsbyville to crush.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Virginia Chronicle, June 18: 1500 level.—From the south drift at point of connection with the old stopes we continue to extract some ore and fillings of average milling value. 1600 level.—We have continued prospecting upward from the old sill floor of the old stopes, from which some ore of fair quality is being extracted, and some very good ore has been taken out along the ore streak on the east side of the old timbers. 1650 level.—Have extracted some ore of fair quality in prospecting west from the upraise 35 feet above the sill floor, which was carried up 59 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from the winza No. 3 (down 73 feet) in working upward from that point. 1800 level.—Along the south end of the drift running south from the crosscut run east from the winza No. 1 sunk from the 1750 level, we have continued to extract some ore from the sill floor upward of milling value. The crosscut running east from the bottom of winza No. 2, sunk from the drift run north from the crosscut run east from the bottom of the winza No. 1 before mentioned, has been extended 30 feet; total length, 59 feet into east country formation. From that east crosscut from winza No. 2, at a point 12 feet in, a north drift has been advanced six feet in a quartz formation carrying a low assay value. There has been extracted from all parts of the mine during the week 1034 1280-200 tons of ore, which was shipped to the Morgan mill, the average value of which, per car samples, was \$34.61 per ton. The average assay value of all the ore worked at that mill during the week, 980 tons, was \$28.38 per ton per battery samples. There was worked at the Vivian mill during the week 223 tons of ore, the average assay value of which, per battery samples, was \$23.89 per ton. Bullion shipped to Carson Mint, assay value, \$30,824.60. Bullion shipped to the company's office in San Francisco, assay value, \$1,996.30.

OPHIA.—1465 level.—The drift running south 101 feet below the sill floor of the 1465 level, from the Mexican into the Ophir ground, has been extended during the week 16 feet; total length, 104 feet, passing through a mixed formation of porphyry, clay and quartz which carried a very low assay value.

MEXICAN.—On the 1465 level the drift running north from the crosscut run east from the bottom of the winza sunk 101 feet below the sill floor of this level near the south boundary of the mine, at a point 40 feet east from the winza, has been advanced 21 feet; total length, 81 feet, continuing in a porphyry formation, showing fine lines of quartz and some clay.

UTAH.—The west crosscut No. 1 from the north drift, 1340 level, from the west crosscut from the shaft station, has been extended 61 feet; total length, 110 feet, continuing in porphyry and clay formation showing some quartz.

SIERRA NEVADA.—West crosscut No. 1 from the north drift from the Kenosha tunnel, 1000 feet in, has been advanced 34 feet; total distance, 137 feet; face in porphyry.

ANDES.—On 420 level, west crosscut No. 2 from north drift on east side of the ledge advanced 15 feet and work stopped in it. Upraise started in north drift between west crosscuts Nos. 1 and 2, was carried up 12 feet and stopped. Will to-day resume work in face of north drift on east side of the ledge.

BEST & BELCHER.—900 level.—East crosscut No. 1 has been advanced 23 feet in quartz giving low assays.

GOULD & CUREY.—400 level.—At a point in west crosscut No. 1, 140 feet from the main south drift, started an incline upraise No. 1 on a bunch of quartz showing some value; carried same up a distance of 20 feet. On the Suto tunnel level the joint upraise with the Savage Company has been carried up a distance of 15 feet; total height, 95 feet; face in porphyry.

HALE AND NORCROSS.—On the 800 level have started a west crosscut opposite the new east crosscut and advanced the same 10 feet; face in quartz and porphyry; also making some repairs to main north drift on this level. 900 level.—Repairing main drift, and extracted from stopes above this level 31 cars of ore. These stopes are not looking well. 1000 level.—Advanced south drift 10 feet; total length from the winze, 65 feet; face shows some low-grade ore. No. 1 west crosscut was advanced 10 feet and stopped; total length, 40 feet; face in porphyry. At a point 60 feet south from bottom of winze, started No. 2 west crosscut and advanced same 15 feet; face in porphyry. 1100 level.—From

north and south stopes above this level extracted 110 cars of ore. The stopes do not look so well as at last report. 1300 level—Have finished the new working station at head of incline and making necessary repairs to main incline at this point for a distance of about 50 feet. From winze below this level extracted 61 cars of ore. Main incline—Have repaired and cleaned out the two compartments of the main incline during the week a distance of 40 feet below the 1700 level. Stopped the extraction of ore from the mine on the 15th inst., but will continue regular shipments to the mill until the ore remaining in the ore house has been shipped. During the week have hoisted 202 cars of ore. Shipped to Brunswick mill 368 1500-2000 tons. Average assay of railroad car samples of ore shipped to Brunswick mill during the week, \$18.14. Average battery assay for the week, \$15.70. Shipped from Brunswick mill to U. S. Mint, Carson, yesterday, 314 pounds of crude bullion; assay value yet unknown.

POTOSI.—The south drift, 250 level, is repaired 55 feet south of Werrin shaft. Raisa above south drift, Potosi winze, 1150 level, is up 14 feet; top in fair-grade quartz. North winze 60 feet north of Potosi winze, 1200 level, is down 14 feet. There is 4 feet of fair ore in the bottom. Arc drifting north from bottom of south winze, 40 feet south of Potosi winze, in quartz assaying from \$15 to \$20. Extracted and sent to the mill in the past week 427 100-2000 tons of ore from the 930, 1000, 1140, 1150 and 1200 levels. Milled during the week 428 tons. On hand at mill, 80 400-2000 tons; average battery assay, \$25.84. Average car sample assays, \$26.43.

BULLION.—The joint Potosi winze is down 383 feet below the 1500 level; bottom in low-grade quartz.

ALPHA.—The joint Exchequer and Alpha south drift from north line of Exchequer, 1800 level, has a total length of 160 feet, face in clay and porphyry.

EXCHEQUER.—The joint Exchequer and Alpha south drift from north line of the Exchequer, 1800 level of the Ward shaft, has a total length of 160 feet, in clay and porphyry.

OCCIDENTAL.—Have extracted and sent to the mill 175 tons of ore of the average assay value of \$23.85 per ton as per battery samples. The Zedig drift from the Suto tunnel is in a total distance of 738 feet.

CON. NEW YORK.—The winze in No. 4 west crosscut, 650 level, is down 12 feet; bottom is in fair-grade ore. The 800 level drift has been repaired to a depth 250 feet northwest of the shaft.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 815 feet. At that point have started an upraise to connect with the 260 level.

Tuscarora District.

NAVJO.—*Times-Review*, June 18: Have started an intermediate drift north from No. 1 chute, 350-foot level; progress 11 feet.

BELLE ISLE.—West crosscut, 250 foot level, extended 11 feet; rock getting harder. South drift, same level, extended 11 feet. No. 1 upraise on the east, 350-foot level, extended eight feet.

NORTH BELLE ISLE.—West intermediate crosscut above the 400-foot level extended 16 feet and connected with north intermediate drift, which has been extended six feet. No. 2 winze, same level, extended nine feet. Have started a crosscut west from No. 1 north drift, same level. South intermediate drift above the south 500-foot level extended four feet.

NEVADA QUEEN.—Second level—South drift from No. 3 east crosscut extended 12 feet; small seams in the face of drift. North drift extended to the Commonwealth line, exposing a foot of good ore. Stopes on west vein show no material change. Stopes in the east vein, where the ore had been extracted, came together, caused by the pressure of water. The only damage was the delay, as we had to wait for the water to drain off, but are working all right now. Hoisted 546 cars second-class ore, which was sent to concentrator, average battery assay \$24.62 per ton, and 36 cars battery assay \$24.1 per ton. Third level—South intermediate drift from No. 3 air shaft has been connected, and started to open out stopes. The ore where we have started shows two feet good grade.

El Dorado Canyon District.

AT WORK.—*Pioche Record*, June 18: At El Dorado canyon, the Southwestern Mining Co. are working about 60 men, including about 23 Indians. The mines look well and much ore is in sight, the most of it being of a lower grade than that worked last year and which netted the company handsome profits. Development work is being pushed ahead, and while ore is taken out from the main bodies, prospecting is being done for more. The majority of all their ores comes from the Mocking Bird and Wall Street mines, and enough is always on hand to keep the mill steadily at work. Accidents have been very few, one, two weeks ago, and of which mention was made in last week's *Record*, being the first in some years. James McGregor, an old Piocher, but for the last ten years a resident of the canyon, has a fine piece of property in the Flagstaff mine. He has made many shipments to Kingman, Arizona, and all have netted him handsomely, being able during the hot summer months to take a three months out to Monterey. He now has ready for shipment eight tons of ore that will average about \$200 in gold and \$200 in silver—\$400 to the ton. He also has a fine copper mine, shipments of which have assayed 29 ounces silver, \$6 in gold and 13 percent copper. John Hens is working on a large body of ore that will average in width 30 feet, but which is very low grade. Morton & Trembath have a lease on the Techaticup mine, and have out about five tons of ore, an average sample of which went \$800 to the ton, the principal part being gold. Mike Connelly has worked the Powers mine, which he pur-

chased last year, steadily since he bought it. It is now looking splendid, and he is taking out some fine ore. El Dorado canyon has always been a high-grade gold camp, and, in fact, heretofore the only one in the county, but it now has its rival in Ferguson district.

BRITISH COLUMBIA.

GRUB-STAKING ON A LARGE SCALE.—*Nelson Miner*, June 20: One of the best equipped prospecting expeditions that ever left Spokane for the north was fitted out by Rudolph Gorbow and Leo Sutor of Spokane, in cooperation with an Eastern capitalist, and started for British Columbia about the beginning of this month. The expedition is in charge of a gentleman who has made the Northwest his home for many years and is familiar with every foot of ground for 100 miles north and south of the boundary line, who is, furthermore, a geologist and mineralogist of some repute, assisted by an experienced prospector, the discoverer of many ledges that since have become famous. At the present time the expedition is working its way up one of the tributaries of the Pend d'Oreille river, and, according to latest advices received, has been successful in discovering some rich placer grounds, the working of which, on a large scale, it is intended to take at once in hand, while the "discoverers" of the expedition are pushing ahead up into the lofty mountains in search of the golden ledges from which these placer grounds must of necessity have received their supply of nuggets. The enterprise is backed by energy and unlimited financial resources.

IDAHO.

GOLD ON CAMAS PRAIRIE.—*Wood River Times*, June 15: Sigle Morrill was in yesterday from Camas Prairie. He reports that the recent discoveries on Soldier mountain have given renewed hope of important mineral developments to the ranchers who have stayed there through good and bad times. No vein in place has yet been found, but several prospectors are digging up the mountain and tracing rich float, and there is no doubt that the vein will soon be discovered. The float found is rich in free gold, partly decomposed, and disintegrates readily in a mortar and pan, showing a broad ribbon of fine gold in every case. All the prospectors find this float, but Peck, Hill and King, who have several locations, find more than the others and have several tons of it piled up. A Chicagoan who visited them a couple of weeks ago offered to put up a mill for an interest in the property, and to have it in operation within 60 days. The offer was rejected without hesitation. Soldier mountain, where this ore is found, rises abruptly above the prairie to a height of over 900 feet. Mr. Morrill, who has mined and prospected all his life, says that these are the best gold prospects he ever saw.

NEW MILL.—*Silver City Avalanche*, June 18: Work on the grade is progressing rapidly, and the walls will soon be commenced. A force of men is now at work quarrying granite for the foundation. The lumber and timber for the mill is being delivered at the site as fast as possible, and the machinery is now at Nampa. Mr. Mackay, who is in charge, is a thorough millman, and everything runs along like clock-work.

BLAINE TUNNEL.—The tunnel is lengthened some five or six feet every 24 hours. A big flow of water still comes from the same, but the drain is now constructed to the fountain head—a mammoth spring—something over 1000 feet from the mouth of the tunnel. A force of men is grading on the hillside opposite for a new and more commodious boarding house. Several windows have been placed in the engine room, adding to the cheerfulness of the same.

RALPH POOL.—A force of men is actively engaged in grading for the new mill, which will be situated near the road, just below the Ruth mine. Development work is principally being done at present, and an air shaft is being sunk to connect the lower levels. The timber for the new mill is now being framed in the lumber yard of the Central Lumber Co. at Caldwell, under supervision of Joseph Hawkins of this place.

PLACER.—Two or three Chinamen are placer mining a small bar of gravel on the War Eagle road, but we "no can say" with what success.

MONTANA.

MARYSVILLE.—*Montana Mining Journal*, June 18: To those who have not kept pace with the march of events there seems to exist a remarkable activity in the mines about and above Marysville, 16 miles northwest of Helena, while to those who have kept advised of the work which has been in progress during the past year and a half the pleasing condition of affairs of to-day appears as but the natural result of the development of a mineral zone of wondrous richness. In point of development the parent mine, the Drumblumun, under the ownership of the Montana Co. (limited) has been opened to a depth of more than 1600 feet and no signs of the exhaustion of pay ore is visible and it gives promise of being a profitable enterprise for years to come. The old Belmont, long idle from causes not due to the ore, is being again worked. On the Empire the Longmaid Bros. have proved that there is profit in low grade milling ore, and these horn miners have acquired ownership of the famous Peuboscot and ere the snow of winter comes the stamps will again be dropping on pay ore. The recently developed Bell Boy now is outputting 50 tons of milling ore a day and has an output capacity of 100 tons. Bald Butte has proved a surprise to the owners and has brought welcome dividends, while as yet it is little more than a prospect. In every direction there is life, promise and realization, and the sun is just over the hills that will rise and

shine on a mining district of wonderful achievement second to but one in the State.

HELLOATE PLACERS.—Favorable reports have been received of the workings of the placer mines in Hellgate gulch, being operated by the owners, W. H. Mackeye and W. R. Barnes. The gulch is in Meagher county, across the Missouri river, and is the next gulch east of Maggie. A bed-rock flume over 800 feet in length reaches bed-rock at a point where there is 14 feet of pay gravel, 11 pans of which have returned two dollars in gold. The property comprises three miles of the gulch, the pay channel averaging 200 feet in width. There is now being utilized 250 inches of water, under a 60-foot head, a force which moves a large quantity of gravel daily. The owners are confident of a rich clean-up this season, a result which will add to the proof that placer mining in Montana is still an important industry.

MADISON COUNTY.—Quartz and placer mining in Madison county gives promise of a season of activity and profit beyond what has been experienced for years. Messrs Fuller & Co., says the *Madisonian*, the lessees of the Silver Bell mine, owned by Henry Elling, are taking out large quantities of \$100 ore. Last week they cut in to a chute of ore, 18 inches wide, that assays in silver and gold over \$1700 per ton, and the chute appears to be extensive. The Silver Bell, which has since its discovery been looked upon as one of the best prospects in the camp, now bids fair to develop into a regular bonanza. This last strike in the Bell has created an interest in the other leads in the vicinity of it, and parties have secured leases on some of them—notably, on the Atlanta, an extension of the Silver Bell—on which work will be begun next week. The outlook for the quartz interests in this vicinity is very bright, and is growing brighter every day.

NEW MEXICO.

HIGH-GRADE ORE.—*Silver City Enterprise*, June 18: The Steeple Rock Mining and Milling Co. made a shipment of high-grade ore this week. The mine is looking well, with streaks of immensely rich ore, some of the fancy samples assaying \$18,000 in gold and \$640 in silver per ton, and yet showing no native gold or silver. The ore is supposed to be a telluride. Kedzie, Classen and App have struck it big in their Hachita mine. A good offer has been made them for the property, but was refused. On Saturday last, the Flagler Company shipped \$5600 in fine bullion gold and silver in the following proportions: Silver at market value, \$1667; gold, 933. The silver was from 990 to 996 fine. This bullion was the product from tailings from the mills after amalgamation of the ore and first concentrates had been taken and shipped to smelters. The average value of the tailings, as worked by the Waring process, was about \$8 per ton, and was only an experiment run to demonstrate beyond possibility of a doubt the practical working of the new process. This has now been proven a success, and the works are now ready to contract for ores in large quantities. If miners will only work their mines now and bring in their ores, they will make a big saving over shipping to foreign reduction works.

ALHAMBRA.—The Hobson mine is in bonanza. The chute of native silver which was first discovered at the surface has been followed and developed at a depth of 175 feet. The dip of the ore chute carries it away from the shaft, and a drift has been started, and is run about 30 feet north, and is expected to cut the ore chute within a short distance. The drift from the 250-foot level has struck the rich ore chute from above, and another ore chute has been struck in the shaft at 255 feet. Samples of the latter strike now lying on the desk where this is written are more than 50 percent pure silver and worth more than \$10,000 per ton. It is hard to appropriately designate the material, whether to call it ore or bullion; it is too rich for any plan of reduction but smelting into bars of fine silver. The Alhambra is showing better with every foot of development. The north drift shows good ore in several places, and some rich ore is being found in the south drift. It takes but a small quantity of such high-grade ore to make a paying mine, and the indications in the Alhambra at present are that re-odies of considerable extent are close at hand; in fact, it looks as if the ore bodies just discovered were the apices of large ore chutes. The Welcome is being worked by John Dodd and Charles Campbell. There is a large body of ore in sight and being developed.

OREGON.

GALE.—*Jacksonville Times*, June 19: Cleaning up for the season has commenced at Ennis & Cameron's mines in Gale creek, Josephine county. A favorable result is expected. Prospectors are investigating into the grand possibilities of the ledges of Southern Oregon at present, and there can be no longer any doubt that there is a great future ahead in the line of quartz mining in Southern Oregon. H. K. Schultz of Roseburg arrived from Myrtle Creek Monday, well loaded with gold-dust from a partial cleanup of the "Blue Rock" mine of Fawcett, Schultz & Co., in Bear gulch. He exhibited a nugget weighing \$40, which is the lightest ever found in that section. Operations at Cinnabar will probably be suspended in a short time, only a small force being employed there now. The mines have been bonded for a round figure, and representatives of both the Siskiyou Q. M. Co. and the syndicate who intend to purchase them are expected on the ground at any time.

MYRTLE CREEK MINES.—*Eugene Register*, June 20: H. W. Holden has been in from the Myrtle creek mines this week. He reports that he has about three weeks' work yet to complete the digging of the ditch for which he has contracted, and will then be kept busy until some time in August putting in the flume work. Two

gients are now kept at work in the mines in the daytime and one at night, and a large amount of dirt is being washed out.

THE GRANITE DISTRICT.—*Bedrock Democrat*, June 20: The warm weather during the past week has melted the snow very rapidly and brought the water with a rush. All creek beds are filled to overflowing. Placer mines, of which there are quite a number, are in full operation. Some of the same are paying handsomely and with an excellent prospect of continuing work until quite late in the season. The amount of snow in the high ranges will furnish plenty of water until late. On the high ranges of mountains on the north slope the snow at present is seven feet in depth, but with a continuance of warm weather it will rapidly disappear. A few of the quartz mines which were in operation during the entire winter have temporarily suspended work for a short time on account of water running into the tunnels. In nearly every instance where any amount of work has been done, the ledges have proven to be of great value. There are several parties in the Granite district from Montana and Colorado, representing capitalists, who are there for the purpose of investing in mining property if they can find suitable mines. There are also parties who have come from other mining countries, who are prospecting for themselves, and have been fortunate in finding ledges which show high-grade ore.

OUR MINES.—A mining boom. At no time has the outlook been as flattering as the present. The new discoveries and mining transfers in our mining circles and the almost certain sales of other mines in the near future, will, without doubt, give Baker county a general mining and business boom. We are in a position to know that heavy sales are on the tapis. Few of our people realize that we are on the verge of the most prosperous era in Eastern Oregon, but before many days the truth of the claim will be recognized.

UTAH.

LITTLE BELL GROUP.—*Park Record*, June 18: Hugh Kilkenny has a block of valuable ground lying between the Lucky Bill, Daly and Anchor mines that gives great promise of developing into something big in the way of a producer with proper development. The group comprises a block of ground 4500 feet in length by about 1000 feet in width, and is mostly patented. The surface indications are most excellent and show that the ground contains two veins—the east extension of the Anchor and the southern extension of the Daly. Mr. Kilkenny has done considerable development work on the group, principally through a tunnel, which is now in about 400 feet and has cut the Anchor vein. Where cut, the vein shows up good and strong and carries ore that assays fairly well, though it is too near the surface to be shipping rock. The vein is a safe guarantee; that, with depth, a mine will be uncovered, and to a man who knows how to estimate the value of a mining claim, it is as good a showing for the investment of capital as one could desire.

GLENCOE.—The Glencoe mill is running one shift and turning out concentrates at a fair rate, though not to the satisfaction of Supt. Curtis nor in keeping with the guaranteed capacity of the mill. The new Wall rolls, recently placed, do not seem to be able to crush the ore fine enough nor in large enough quantities, and it seems impossible to make them come up to the specifications in the contract. The first car of concentrates was shipped this week over the Utah Central to the Conkling sampler in Salt Lake, where it will be sampled and sold on the open market and the value of the Glencoe ore thoroughly established. Several of the heavy stockholders in this mine were in the Park this week and made a thorough examination of the property. They were highly pleased at the prospects for a dividend-paying mine.

ORE AND BULLION.—Monday last the Marsac mill shipped 9 bars bullion containing 10,645 fine ounces of silver. Since our last issue the Ontario mill has shipped 46 bars of bullion containing 24,974.63 fine ounces of silver. The Crescent shipped this week 507,000 pounds of concentrates and 25,000 pounds of first-class, making the total from the camp for the week 3,414,620 pounds, or over 1707 tons.

WASHINGTON.

SANDS STRIKES IT RICH.—*Okanogen Outlook*, June 20: Parties just in from the Palmer mountain country report a rich gold strike about 2000 feet east of the Reinhold claim, by the irrepressible C. C. Sands. It is on a ledge which has been considered barren and worthless; prospectors have picked at it and pessed it by, as the croppings did not show mineral. About two months ago Mr. Sands located the claim, and last week started to do a little work on it. Nearly the first shot put into the ledge threw out quartz carrying free gold in large quantities. Our informant saw some of the ore at Loomiston, and pronounced it as rich as any he has seen in the country. The pay streak is 16 inches wide, and heavily mineralized with free gold.

GOLN.—Chas. Gaupin is working on a promising gold ledge in Toats Coula, opposite the Douglas mine. He is taking out some very rich free gold, and will shortly have a mill test made of the ore. An \$8000 shipment of bullion from the Black Bear mill was made last week, as the result of a ten-day run. As the capacity of the mill is 12 tons per day, the above result would give the ore an average value of \$66 per ton. W. H. Abbott and T. D. Houston are developing the St. Lawrence, a strong eight-foot gold and silver-bearing ledge located 2½ miles south of Conconully. A 30-foot tunnel on the vein shows a well-defined pay chute of gray copper ore, and from the way it has improved in the last ten feet, the prospects are that it will soon develop into a good body of high-grade ore.

MECHANICAL PROGRESS.

Possibilities.

While the present century, or even the latter half of it, has been unusually prolific in new developments of science which have opened up new opportunities for supplying mankind with the necessities or luxuries of life at less cost of strength and time, it is possible that none of them are destined to accomplish more or prove a greater benefit to humanity than that which is being made to convert the natural forces of nature into an electrical power, by which their energy can be preserved, stored and transmitted by wire to far distant points, there to propel machinery, light streets and dwellings, and furnish heat or power for all purposes, from the baking of a cake to the melting of iron ore or the forging of an anchor.

If the vast power of the Falls of Niagara can thus be transmitted for hundreds of miles, the power of the little brook may be taken at least for shorter distances, and there would seem almost no limit to the power of man to confine, harness and drive at his will all the hitherto wasted powers that have rendered but partial tribute to mankind.

The running water and the passing breeze have long been utilized for certain purposes, and the forked lightning has been made an obedient and useful servant to those who have learned to bandle it.

But as the population of the earth becomes more numerous, and at the same time more exacting in their wants, there must be developed new sources of supplying those wants, or the old sources must be put to better uses, or used with greater economy.

Electric power now seems the most efficient power we know. But its one drawback has been the power of generating it, excepting under favorable conditions. If it can be generated from the waste powers of nature, or what have seemed such, not only the falling water and the wind, but from the fall of fruit from the trees, or the tread of men along the busy street (for who can say where our limit is to be when the work of progress is fairly begun?) when all this power can be saved, kept until needed, sent where it is called for and used for almost every purpose that is required, we shall have reached a point where the wildest imagination of man would not have reached a few years ago.

We may live to see the waters of Niagara lighting the streets of Boston and New York, and the coldest blizzard that sweeps the plains of Texas or Dakota heating the houses of Chicago, and the restless beat of the waves upon the seashore may propel the cars that climb the mountains of New Hampshire, and the freezing of our ponds may even warm our greenhouses if the energy of these powers can be first changed into electric power.—*Manufacturer's Gaze te.*

CABLE ENGINES.—The cable-driving engines for the power plant of the Broadway cable railway, New York, are being built by the Dickson Mfg. Co., of Scranton, Pa. At the Houston street station will be four simple, noncondensing engines, with cylinders 38x60 inches, and at the Fifty-first street station two similar engines, with cylinders 36x60 inches. The Corliss valve gear is used, and each engine has a 24 foot fly-wheel, built up of nine segments, and weighing 100,000 pounds. The frame of each engine is one large rectangular box casting, extending from the front cylinder head and including the main pillow block. The weight is about 34,500 pounds. The girders are formed to this frame, and have top and bottom slides of curved section, bored out from the end. The crosshead slides are curved to correspond. The crank pin is 11x11 inches, with a crank arm 11 inches thick on a main shaft 18 inches in diameter, the main bearings being 18x30 inches. The power of the engines, with an initial pressure of 150 pounds and a speed of 60 revolutions per minute, is rated at 1200 horse power for each of the larger and 1000 horse power for each of the smaller engines.—*Engineering News.*

SAND BLAST.—The peculiar fact is remarked upon in the *Engineering Journal* that, as compared with English practice, the sand blast process has found but little favor in the United States, a single company in Sheffield using at least 200-horse power of steam in its operations, and the application elsewhere in Europe being extensive for various purposes. In Sheffield the main utilization in this line is the recutting of new files to improve them. The process is familiar by which files are cut with chisels that raise up shavings or teeth, these being of curved

form and with a thin edge that soon crumbles or breaks, unless the cutting is skillfully done and the steel of good quality. When treated by the sand blast, the files are held at an angle, so that the sand impinges on the back of the teeth, cutting away the thin edge, but not affecting the face, the teeth thus becoming strong cutters without the thin curled edge left by the chisels in cutting. The operation is very rapid, requiring but a few seconds, and the value of the files is much increased. Sand, however, in the common sense, is not employed in this process, but a mixture of sandy clay and water thin enough to be circulated by pumps.

Overrating Steam Engines.

It is sometimes the case that steam engines are overrated by manufacturers, as to power, says the *American Mechanic*. This is partly due to the sharp competition in the steam engine trade and partly to a desire to get, or to appear to get, a good deal of power into small space. It is one thing to demonstrate that an engine can be made to develop a given horse power, and quite another to run that engine economically year in and year out developing that amount of power. A steam engine is, speaking from an engineering standpoint, of no greater power than it will economically work at continuously, or practically so, without requiring constant humoring.

But there is one redeeming feature in the overrating of engines. That is, the power required is in the majority of cases overestimated, or a large margin is left for possible future requirements, so that the power actually required is below that called for in the purchase, and the engine is better adapted to the work than if operated at its rated power. While this does not excuse the practice of selling engines under too high rating, it is sometimes a disguised blessing to the user, for it is a fact that is well known, that an underloaded engine—an engine too large for the work it has to perform—will show poor economy in spite of all attempts to remedy it by varying the steam pressure or speed, although something may be accomplished by the latter means.

Occasionally the overrating business works badly. Instances sometimes occur where the power required is underestimated rather than overestimated, and without any reference to economy it has been found impossible to get the engine to work at the power at which it was rated in the sale, which is bad for the builder.

SCIENTIFIC PROGRESS.

Fuel vs. Illuminating Gas.

At the recent annual meeting of the Western Gas Association, held at Detroit, Mr. K. Mitchell read a paper in which he gave a coal gas manufacturer's views of fuel gas. Mr. Mitchell said: In looking over the various processes of making fuel gas we see several methods of accomplishing the same end. It is pretty generally conceded among fuel gas men that a process which will allow of bituminous coal being charged into the top of the retort or generator, and pass down by gravity until the several processes of distillation are completed, leaving nothing but the clinker and ash to be removed at the grate below, is the most desirable. The value of the resultant gases for quantity and quality depends upon the quality of the coal introduced into the generator, as the heating agents are hydrogen, carbonic oxide, marsh gas, and a small per cent of olefiant gas. To produce a gas that is richest in heat units you must have a coal that produces a large quantity of good coke. In order to decompose the steam, incandescent carbon is necessary. The composition of gases from bituminous coals is given as follows: Hydrogen, 54.5; carbonic oxide, 36.4; carbonic acid, 1.6; marsh gas, 7.5. It is also absolutely necessary in vending a fuel gas, particularly a gas which contains over one-third of its volume of deadly poison, and which is to be used for domestic purpose, that it have a distinct and positive odor, an odor that will be lasting when mixed with air.

It will be seen by the above analysis that the only odor to the gas is from the small per cent of marsh gas. In our regular illuminating gas we get the well-known carbonaceous odor from over 42 per cent of its volume. The slightest leak upon a fixture or burner accidentally turned on, or burner in gas stove, which may be extinguished from boiling over of the contents of a kettle, is quickly detected and remedied. Not so with fuel water gas. If a burner is accidentally turned on and not lighted the presence of the deadly fluid is not detected by the victim. In order to remedy this great objection to fuel water gas, fuel gas makers

have introduced into the gas, while being generated, a few gallons of oil to each 1000 feet manufactured. Another plan is to allow the purified water gas to pass over crude Lima oil, which is periodically injected upon the water in the gas holder tank. The latter plan gives to the gas a perceptible odor at the point of escape, but the odor is not enduring and clears away or separates from the gas quickly.

The question to the consumer is not what is the theoretical value of the gas or air dilution to complete combustion of the gases, but how much monetary value can he get out of them; i. e., how many feet of gas will I consume a month doing my cooking or heating by gas when consumed in the best means at hand.

We have before us two cooking stoves, both of the best and latest patterns, made especially for the work for which they are intended. One is a stove fitted to burn coal gas, 16 candle power; the other is fitted to burn fuel gas with illuminating power, and of the composition as given in the before-mentioned table. We must gauge the stoves so that, when in use, the work can be done as expeditiously with one kind of gas as with the other. With the coal gas cooking stove we beat the oven in 15½ minutes from a temperature of 76°, ready for baking, consuming 6½ feet of gas. We place in the oven a six-pound pan of bread, regulating the gas to properly bake the bread. When baking is done, we note the time from the lighting of the burners to the completion of the operation. Total number of feet of gas burned, 17.5; pressure of gas, 14.10; total time, 1 hour 33 minutes.

With a fuel water gas stove of the same dimensions, we heat the oven in 17 minutes from a temperature of 76°, ready for baking, consuming 20 feet of gas. We place in the oven a 6½ pound pan of bread, regulating the gas to properly bake the bread. When cooking is done, we note the time from the lighting of the burners to the completion of the operation. Total number of feet of gas consumed, 64; pressure of gas, 32.10; time, 1 hour 28 minutes.

In boiling water upon the coal gas stove, we place over one of the top burners a vessel containing two quarts of water, temperature 48°. We bring the water to a boiling point in ten minutes' time, consuming 2.8 feet of gas. In boiling water over a fuel water gas stove, we place over one of the top burners of the stove a vessel containing two quarts of water, temperature 48°. We bring the water to a boiling point in 11 minutes' time, consuming 5.5 cubic feet of gas. We light all the burners of the coal gas stove; gas consumed, 60 feet per hour; pressure, 16.10. All the burners of a fuel water gas stove lighted consume 160 feet of gas per hour; pressure, 32.10.

In summing the matter up, the writer cannot see where there is anything done by fuel water gas that cannot be done by the illuminating gas now at hand. In cooking or heating stoves, one foot of illuminating gas will do more general work than two feet of the fuel water gas. It takes less capacity of mains, meter, etc. For example, to convey a certain amount of fuel water gas, a ten-inch main is required. To convey the same equivalent in heat units of illuminating gas, a main of seven-inch diameter will do the work.

Color in Plant Life.

Those familiar with the growth of flowers know how essential light is to the creation of color. The most gaudy blooms and the most brilliant foliage, if kept in the dark or overshaded, will become pale and almost white. This fact (according to the *Horticultural Times*) shows the presence in the plant of some chemical agent which is acted upon by the actinic rays. To some extent, this chemistry of nature is understood by florists, who, by the use of chemical manures and other means, strive to take the greatest advantage of it. For instance, it is a common practice to mix alum and iron filings with the soil in which certain plants are grown, in order to bring out special colors. The bluish-tinted hydrangea is the result of such treatment. Salts of iron, or sodium phosphate, added to the soil, turns the crimson of the peony to violet and produces blue bortensias. According to Dr. Hansen, who has studied the subject very closely for many years, there are only three distinct pigments to be found in flowers—setting aside the chlorophyll, which forms the green coloring matter in all plants. These colors are yellows, reds and blues. The yellows are mostly in combination with the plasmic sap, while the others exist chiefly in solution in the cell sap. The yellow pigment forms an insoluble compound with fatty matters, and is termed lipochrome. Orange is formed by a denser deposit of the yellow, and the color in the rind of an orange is identical

with that found in many flowers. The red in flowers is a single pigment soluble in water and decolorized by alcohol, but capable of being restored by the addition of acids. Lipochrome combined with this red pigment produces the scarlets and reds of poppies and of the hips of hawthorns, but the varying intensity of reds in roses, carnations, peonies and other flowers depends on the presence of a greater or less quantity of acids. The blue and violet colors are also decolorized by alcohol, but reddened by acids. Florists have already succeeded in producing a very large scale of unusual colors in flowers, and there seems to be very good grounds for believing that it is possible so to manipulate nature that she will produce blossoms of every conceivable tint and hue.

Behavior of Aluminum Toward Mercury.

Helbig makes the following communication on this subject to the *Pharm. Centralhalle*:

If a little mercuric chloride (or other mercuric salt) is placed upon a piece of metallic aluminum, white, hairlike formations will at once be seen to rise from the surface. These grow during a short time considerably (several centimeters during about 15 minutes). They are generally so fine that they can be blown away. To succeed with this experiment, the aluminum must be at least moderately clean.

The reaction may be employed for purposes of amusement. A very handsome result is obtained if the recently introduced aluminum penholders, having the form of bird's feathers, are coated with a strong solution of mercuric chloride. This will cause apparently additional feathers to grow out of the metallic one.

The reaction may also be used as an example of the inconsistency of the assumed law that bodies act upon each other only in a liquid condition, since the same phenomenon is observed no matter what liquid is used for dissolving the mercuric salt. On the other hand, when dry mercuric chloride is applied to metallic aluminum, the formation of "hairs" occurs even more rapidly than when solutions are employed.

The nature of the reaction is this: First, an aluminum amalgam is formed. Next, the aluminum dissolved by the mercury is oxidized by the air and converted into alumina; this is shown by the fact that when a piece of aluminum is put into a solution of mercuric chloride, metallic mercury is separated. On the other hand, the "hairy" feathers are not formed if the reaction is attempted with exclusion of air.

THERMOMETER FOR HIGH PRESSURES.

A reliable thermometer for high temperatures, as described in the *Philosophical Magazine*, has at last been devised, the instrument being made in the form of a platinum resistance, the simplest shape of which consists of fine wire welded to leads of comparatively low resistance; the electrical resistance of such a wire varies according to its temperature, so that the reading of the one gives the other by consulting a table prepared with reference to the zero of the instrument. Siemens' well-known electrical pyrometer depends upon the same principle, but in this case the zero is known to change largely and continuously—an effect due, it is alleged, to the imperfect design characterizing the Siemens apparatus; the fact being that, if the wire is pure to start with, and is protected while in use from strain and contamination, its resistance, after having once been annealed, is always very near the same at the same temperature. The improvements now announced in the platinum resistance thermometer, or pyrometer, consist in the better protection and treatment of the platinum wire, and this is differently treated according to the heats to which it is to be exposed; for temperatures below 700 degrees Cent., the leads may be of copper or silver and the tube of hard glass, or, for work below 1,000 degrees, a wrought iron tube may be used.

COTTONSEED HULLS.—Travelers in the South have frequently been impressed with the annual waste of several hundred thousand tons of cottonseed hulls, and it is satisfactory to know that steps are now being taken to utilize this waste. Improved appliances are likely to lead to the use of the refuse in the manufacture of certain classes of paper almost exclusively. The cottonseed hull is like the scale of a fish, and when it is treated becomes pure cellulose. It is absorbent to a wonderful degree, and will in all probability enter largely into the future manufacture of blotting paper.—*Mag-nolia Gazette.*

ELECTRICITY.

The Lesson of English Mining Development.

In the application of electricity in its three-fold manifestation of light, heat and, power to mining operations, America has taken such a decided lead that it is another case of "Eclipse first the rest nowhere;" but mainly through the efforts of a few determined and progressive English mining engineers, who have, with watchful and jealous eyes, noted the American development, the English miners are awakening to the immense advantages that are to be found in this agent of progress. The backwardness of England in this regard has been due, in a large measure, to the unreasoning and in many respects fanatical prejudice against the trolley wire. Englishmen have, like the rest of the world, been waiting for the perfecting of the storage battery, but, unlike the rest of the world, England has not been willing to make use of any other system while waiting for the ideal one. The result has been that England has been largely left behind, but there are signs that even there some progressive spirit is being aroused, and there are those who believe it a wise policy to take advantage of the existing methods while waiting for improved ones. Electric railroads operated by the trolley system, and electric motors and locomotives in mines, run by the same system, have been so overwhelmingly successful in this country, that even the most cautious and conservative Englishman now begins to see the necessity of doing something to gain some of that success in his own country.

Those pioneers in the art, who have spent time, labor and money in assisting this development, who have labored on through discouragement, disaster and prediction of failure, have their reward in seeing their ideas taken up by those who most loudly decried them in the beginning. Of electric power it once might be said, "Despise not the day of small things;" but that cannot be said now, for that day has passed, and it is a day now of large things, but though large as compared with the very recent past, yet small when the future is considered. The day is not far distant when every dwelling will be lighted and heated by electricity, when every industry will hear the hum of the electric motor, and coal and steam will be confined to the large electric generating plants, located in convenient centers of trade and population, whence the mysterious yet beneficent electric current will radiate in all directions, carrying with it unlimited possibilities for ministering to man's comfort, happiness, mental, moral, physical and pecuniary welfare.

But this development will not come by idly sitting down and waiting for it. It will be worked for, by utilizing the present resources, improving them and extending them, and taking quick advantage of every new scientific discovery. Our English brethren are learning their lesson as we in America have learned it, and the result is that in both countries the indications are that we are on the threshold of new and important discoveries in the field in which we are all laboring.—Electric Power.

CARVING STONE.—The Chicago *Journal of Commerce* says that the carving of stone can now be done in less than half the time formerly occupied, by the use of an electrical reciprocating tool. This can be regulated to strike a series of blows at any speed and with any degree of force, and thus the physical labor hitherto necessary is done away with. The instrument is also coming into use in the studios of sculptors, who are much hampered by the material restrictions involved in the working out of their ideas. The sculptor can now devote his entire attention to the lines the instrument is to follow, and the cutting of the marble is done far more rapidly and accurately than by muscular power.

CONDENSERS IN ALTERNATING CURRENT DISTRIBUTION.—Although the application of condensers in alternating current systems has not yet been made an accomplished fact in practice, yet the possibilities and advantages make this a subject of considerable interest at the present time, even though it may be quite a while before actual work is done in this direction. Swinburne, Stanley and others are working hard in this field, and it is not unlikely that they will arrive at some very useful results sooner or later. As the behavior of condensers in alternating current circuits is, perhaps, not well understood by many, we publish in another column a short but clear summary of the subject, which, without considering the whys and wherefores, shows the different ways in which condensers may be con-

nected, and how they will act when thus introduced into branch or main circuits. It will doubtless be difficult for many to understand the apparently curious fact that a condenser in circuit may raise the potential far above that used to charge it. It acts in this case similarly to a transformer, changing volts into amperes and amperes into volts, so to speak, or more correctly, changing the quality of the energy. As the condenser may in future play an important part in alternating current work, a clear understanding of the underlying principles will help one greatly in dealing with the problems which must come up.—Electrical World.

PREVENTION OF SPARKING IN DYNAMOS. An ingenious arrangement for preventing sparking between brushes and commutators has recently been devised by M. Deprez. The commutator is made in two parts, so placed that the conducting bars and insulating spaces, which are of equal width, alternate with one another in the two halves. The current is collected by two brushes on each side, joined by a resistance, from the center of which the main circuit is taken. A battery of accumulators added to this circuit has just sufficient E. M. F. to oppose that of the coil undergoing short circuit, and thus the inventor is said to have run high-pressure machines with absolutely no sparking.

A NEW METHOD for carrying electric wires for a trolley system in a mine has been devised. It consists of a post pointed at either end. The pole is cut at the middle, and by means of a threaded screw and handle, the two parts may be separated at will. To use this extensible stand, the conductor is first secured in the clamp at the end of a bracketed arm, and then the whole affair is so arranged that the points at the opposite ends are adjacent to the top and bottom of the mine. Revolving the handle, forces the pointed post in different directions, until the pole is in a firm position. The handle may be then set by means of a screw.

USEFUL INFORMATION.

A NEW OPTICAL APPLIANCE.—Every draughtsman knows the convenience of the sectional-ruled drawing papers when making rough sketches for new designs. The instrument we now describe is intended to give the same or greater advantages without the necessity of using expensive lined paper. It is simply a photographic lens mounted at the height of twice its focal distance above the sheet of plain drawing paper. At a similar height above the lens is a sheet of plain glass the same size as the drawing board. Sheets of transparent celluloid or other suitable material, having opaque patterns produced on them by photographic or other means and laid upon the surface of the glass can, of course, be illuminated by daylight or artificial light in such a way that an image of the patterns will be projected on the surface of the drawing paper. There is, of course, no reason why the patterns and the projected image should not be of unequal size, if desired. But the arrangement described is said to be preferable. A base line for the sketch or drawing is given by the T square, and a couple of ruled plates—one having diagonal and the other concentric circular lines—do the rest.—Optician.

POLISHED WOOD.—For various ornamental purposes, wood with a mirror polish is now being satisfactorily employed in Germany as a substitute for metal. In carrying out this plan, the wood is suitably prepared by being first submitted to a bath of caustic alkali for two or three days at a temperature of about 175° F., then dipped into hydro-sulphate of calcium for about 24 to 39 hours, after which a concentrated solution of sulphur is added. After being subjected to another dip in an acetate of lead solution at about 100°, a shining metallic surface is imparted by polishing when dry with lead, tin or zinc.

THE COCOANUT TREE abounds in South Florida. It is not a native, nor has the fruit been cultivated for any great length of time. The introduction is attributed to the wrecking of a Bahama vessel. Some of the cocoanuts forming its cargo were planted and made trees, which have thriven wonderfully. In Dade county, one of the southernmost counties of the State, which has a sea front of 150 miles, there are now groves of great beauty containing from 100 to 6000 trees.

A METHOD of utilizing the waste heat of slag has been patented by Messrs. Howell and Ashcroft of the Proprietary mine, Broken hill, Australia. The idea is to run the

molten slag into iron chambers capable of withstanding pressure, and to raise steam by spraying the red-hot slag with water. If the method succeeds in practice, it is said that the Proprietary mine would save £30,000 per annum in fuel.

GOOD HEALTH.

Abnormal Breathing.

Neither man nor animal breathes through the mouth normally, says the *Manufacturers Gazette*. The only natural way for respiration and inspiration is through the nose. When we breathe through the nose, the cold, dry, impure outward air is sufficiently warmed, supplied with watery vapor and freed from dust. When we breathe through the nose, smelling at the same time through our organ of smell, which assists respiration, we become aware of the presence of an injurious or of a generally abnormal mixture drawn in by the breath, and can then either correct so unfavorable an atmosphere or escape from it. Furthermore, only in the nose are found those fine arrangements which can prevent the entrance of injurious substances into the deeper respiratory organs (larynx and lungs) and thus stop the further advance of the hostile body (painful smoke, irritating dampness, thick dust, etc.), besides defying that which has already slyly effected an entrance. This is done by the so-called nasal reflex breathing, to which class belongs sneezing.

If we breathe through the mouth the air is neither sufficiently warmed nor satisfactorily moistened, and laden with all its bad mixtures of dust of mineral, animal and vegetable origin, added to injurious gases, reaches the larynx, the air tubes and the lungs. Snoring is only the least among the evil consequences of breathing through the mouth. The swollen, sore, constantly chapped lips, had condition of the front teeth and decay of the back ones, a defective development of the sense of smell, frequent inflammation of the throat, attacks of fever, diphtheria and catarrh, and soreness of the larynx and lungs are consequences of breathing through the mouth which have been frequently observed. In children one often sees an habitual and peculiar weak or even stupid expression of countenance. It has also been found, through the experiments of different trustworthy observers, that there is a casual connection between stammering and breathing through the mouth. On the other hand, however, certain forms of nightmare and asthma are causes of breathing through the mouth. That infants are sometimes brought almost to death's door when prevented by a cold from breathing through the nose is a fact well known to physicians.

When a child or grown person begins to breathe with the mouth open there must exist some sufficient cause for the occurrence in the uppermost air passages. No one would voluntarily exchange the only healthy, comfortable manner of breathing through the nose for the burdensome and unhealthy breathing through the mouth. Let any one attempt to breathe through the mouth for five minutes, instead of, as one is accustomed, through the nose, and he will soon be convinced that it is almost impossible. Almost of itself, that is, without muscular force, through the mere pressure of the air, the mouth closes, and the original manner of breathing is resumed.

Whoever snores can, as a rule, not breathe through the nose. That it would be useless in such cases to desire to close the mouth mechanically is entirely comprehensible. Every mother, who frequently gives to her child the useless command "close your mouth," is aware of this. Here it is better to seek, without delay, the advice of an experienced specialist, in order to determine the cause of this mouth-breathing. In the case of children, in particular, an unnecessary delay may prove fatal.

Now there are certainly cases in which the cause of this habit may be determined and the habit still remain. But these are the exceptions; as a rule normal breathing results as soon as the air enters the correct passages; if the snoring and breathing through the mouth returns as an evil habit, then and only then can mechanical means be used with advantage to stop this opening of the mouth.

The simplest and oldest of these is to place a hand from the chin to the top of the head. This often suffices. As the mouth remains closed by pressure of the air, some of the mechanical appliances to produce this effect might be used. Sometimes it is even sufficient to place a piece of celluloid plate between the teeth, but one would not likely decide to place a foreign substance in the mouth of a sleeper, particularly a restless child.

Mexican Mining Law.

An Outline of its Principal Points.

The following are some of the leading points in the new mining law of Mexico. It has been radically changed from the old law, and those intending to go into Mexico to mine had better post themselves.

The mineral substances for whose exploitation a concessions is in each case necessary are:

Gold, platinum, silver, quicksilver, iron, except that in water or in ochres that are worked in the same manner as coloring materials; lead, copper, tin, antimony, nickel, cobalt, manganese, bismuth, arsenic, precious stones, rock salt and sulphur.

The owner of the surface can work freely, without the necessity of a special concession in any case, the following mineral substances, combustible minerals, mineral oils and waters, the rocks in general of commercial value for building and ornamental uses; valuable clays and earths and sand of all classes; mineral substances except those noted above.

Mining property acquired according to the specifications of this law will be irrevocably and perpetually, upon payment of the federal fees, the property of the exploiter.

Waters proceeding from the subterranean works of mines are the property of the owners of said mines, who must observe the specifications of the common laws in directing the course of these waters.

The works required for the exploitation of the mines and placers are of public utility; and if there is lack of agreement there can be a forcible condemnation of the lands necessary for this purpose.

All inhabitants of the Republic have the free right to explore the public lands for minerals, but no excavation shall exceed ten meters in width, length or depth. For this much space no license will be required, but it is obligatory to notify the proper authorities.

In lands owned by private parties it is not lawful to prospect for mines without permission of the owner, or representative, but in case this permission is not obtained the prosecutor can apply to the proper authorities, who will estimate the damage caused by the explorer in the presence of the owner of the lands, or his representatives, and require a bond to be given by the prosecutor.

Within private building and ground belonging thereto, prospecting can only be made with permission of the owner. It will not be lawful to explore for minerals within the limits of any city or town, nor within public edifices or works, nor within fortifications and adjacent grounds.

In all such cases the regulations fix the minimum distance to which these explorations can be carried.

A mining claim or "pertenencia" shall be a square of 100 metres on each side and of indefinite depth.

The mining claims will always be given to the first persons soliciting them, and will embrace in every case the number of "pertenencias" (whenever there is sufficient free territory) that may be asked for by the interested party who should specify in the clearest terms, and in accordance with the laws, the location of the "pertenencias" embraced in the claim.

The concessionaries having obtained title to property, possession can be taken at once and without other formality.

The societies or companies formed for the exploitation of mines shall be formed according to the commercial code and civil code of the federal district, except that part which is not admissible on mining subjects.

The contract, which has heretofore been known as "Avio," will, in the future, take the form of a stock company, or of a mortgage.

The new tax imposed in all mining concessions, excepting those expressly exempt by contract, will be a federal property tax and will be established by special law.

In respect to taxes on mines the specifications of the law of June 6, 1887, will be observed.

The contracts for the exploration and exploitation of mining zones concluded with the Department of Public Works, Colonization and Industry which may be still in force when this law takes effect, will remain in vogue for the whole of the stipulated term if the concessionaries so desire; however, these concessionaries may, upon the promulgation of this law, accept its provisions within the term of one year by making the necessary declaration to the department, and they will be relieved from the obligations imposed by their contracts.

This law will go into force the 1st day of July, 1892, from which date the Mining Code of Nov. 22, 1884, and all the circulars and rulings relative thereto, become abolished,

EMMONS, the eldest son of Mr. Blaine, died at Chicago on last Saturday. He had been sick but a day, and only for a few minutes before his death was his condition known to be serious. It was a sudden and awful stroke, the more sad as it followed within a year the death of a sister and a brother. The young man was a conspicuous figure at the Minneapolis convention, and took seriously to heart the failure of that occasion, and it is believed that his death resulted from nervous reaction. He was an attractive and lovable man, aged 35, a husband of three years and very recently a father. In a career apart from the political life of his family he was notably successful, and he was the pride and hope of his father, now in many ways sadly bereft. The heart of the country has gone out to his family in a grief for which there is no balm. In the first session of the National Democratic Convention, on Tuesday—a convention met to combat the political principles of the great Republican leader, and in which there was no political friend of his—somebody moved a vote of sympathy with Mr. Blaine. Every man in the hall arose in approval. The chairman declared the resolution unanimously carried. Tears came as men grasped hands, and the great building rocked with the thunder of their cheers. Truly, the old passions of politics are passing away—thank God for it!

A Lost Fight.

There is small comfort in the political situation for the advocates of free silver coinage. Both Harrison and Cleveland are committed positively against it, and the platforms upon which they stand are framed in correspondence with their views. In each of the silver planks there is an artful attempt at double meaning, but when taken in connection with the nominations, they stand alike for the gold standard. The Republican plank is as follows:

The American people, from tradition and interest, favor bimetallism, and the Republican party demands the use of both gold and silver as standard money, with such restrictions and under such provisions, to be determined by legislation, as will secure the maintenance of the parity of values of the two metals, so that the purchasing and debt-paying power of a dollar, whether silver, gold or paper, shall be at all times equal. The interests of the producers of the country, its farmers and workmen, demand that every dollar—paper or coin—issued by the Government shall be as good as any other. We commend the wise and patriotic steps already taken by our Government to secure an international conference, to adopt such measures as will insure a parity of value between gold and silver for use as money throughout the world.

The Democratic platform shows how the same thing can be said in a different way, as follows:

We denounce the Republican legislation known as the Sherman Act of 1890 as a cowardly makeshift, fraught with possibilities of danger in the future, which should make all its supporters, as well as its author, anxious for a speedy retreat. We hold to the use of both gold and silver as the standard money of the country and to the coinage of both gold and silver, without discriminating against either metal or charge for mintage, but the dollar of the unit coinage of both metals must be of equal intrinsic and exchangeable value, either adjusted through international agreement or by such safeguards of legislation as shall insure the maintenance of parity between the two metals and the equal power of every dollar, at all times, in the markets, and in the payment of debts; and we demand that the paper currency be kept at par with and redeemable in such coin. We insist upon this policy as especially necessary for the protection of the farmers and laboring classes, the first and most defenseless victims of an unstable money and fluctuating currency. We recommend that the prohibitory ten per cent tax on State bank issues be repealed.

There is a truce between the two great parties as to silver, and there seems no prospect that it will be broken during the next five years. Nothing is more certain than, if Congress were to enact a free coinage measure, that it would be vetoed in the White House. For the present, the fight is lost, and, however unpleasant the fact may be for silver advocates, no good can come of attempts to deny or evade it. Of all forms of deception, self-deception is the worst. It is the voluntary assumption of blindness.

The discussion of the coinage question during the past six months has been to the disadvantage of silver. The gold standardists have succeeded, not, indeed, in convincing the country, but in alarming it. They have brought to bear against silver the influence of the doctrinaires, the bankers, the capitalists, the chief political leaders, and the vast hosts of the timid. Against the force of these united elements it has been impossible to make headway—hence the result. It has been the misfortune of the silver cause to have no advocates save those who directly represent the money interests involved or the political interests connected with them. The college professors, the financial experts, the capitalists (save only the silver capitalists of Colorado and Montana), have all been on the other side. The silver cause will not be given up, for the abiding conviction of its justice remains with its advocates, but they must have the courage to look squarely in the face five years more of waiting.

THE COCOPAH COUNTRY.—John Albright, a well-known mining man, who has just returned from the Cocopah country, in Lower California, reports the discovery of a new mineral district, including one large vein mining \$150 in gold to the ton, with traces of silver. A further investigation of the region revealed rich deposits of alum and sulphur, with at least five parallel lodes of gold-bearing quartz. Placer gold is also found. A party is being organized in San Diego to prospect the region. According to the description of the finds, they are not far from the garnet mines lately discovered by Brown and Crawford.

The powder companies are having dull times and there is again talk of a pool.

Is This Reform?

Amidst the congratulations of friends and to the delight of the "street," James L. Flood, at the last annual election of the Hale & Norcross Mining Co., took control of that company. The gentlemen who were elected directors were known to be his friends, and every one congratulated themselves that this magnificent property would now be put on at least a self-supporting basis.

Its stockholders had been scandalously robbed by the outgoing Board of Directors, who were publicly proven either to have, by their passiveness, consented to the defrauding of the owners of the mine, or to have accepted a share of the loot.

Prominent rich men and officials had been publicly branded as robbers, and it was supposed that the lesson taught these people would not be lost on the new management. What do we find?

That this new management sent the ore extracted from the mine since their assumption of power to the Brunswick mill, where it was found impossible to make \$20-free-milling ore pay but little more than milling charges. As a culmination of the reform management, they have adopted the following resolutions:

Meeting June 13, 1892. Present, Directors Messer, Wells, Fish, Lyle, Hart, Gurnett and Edwards, being a full board.

On motion of W. S. Lyle, seconded by Mr. Geo. R. Wells, it was unanimously "Resolved, That this company file a supplemental answer in the case of M. W. Fox vs. The Hale and Norcross S. M. Co. et al. (No 30,508 in the Superior Court of the City and County of San Francisco, Department 4), and that Mr. W. H. H. Hart be appointed as attorney for this company to file such answer and to take such steps as he may deem proper to fully protect the rights of this company under said judgment, and said W. H. H. Hart to be substituted as attorney for this company in the name and stead of the attorneys who have heretofore filed answers for this company" (Hart not voting. Unanimously carried).

June 16th, 1892.—Continuation of adjourned meeting of June 13th.

Present: Directors Messer, Wells, Lyle, Fish, Edwards, Gurnett and Hart.

The following resolution was offered by Mr. Gurnett:

Resolved, That Mr. Wells (of the Board of Trustees) be authorized to attend to the suit of M. W. Fox vs. The Hale and Norcross S. M. Co. et al. in place of Mr. Hart (also of the Board of Trustees) without any further compensation than his present salary.

This resolution was seconded by Mr. Edwards.

The following amendment was then offered by Mr. Fish:

Resolved, That this corporation employ Mr. W. H. H. Hart as attorney for this company at the following compensation: First—\$2000 cash down, \$1000 when the case is in the Supreme Court for argument, and \$2000 cash when the case is finally ended. Second—A balance of \$5000 contingent that defendants in the case pay judgment into the treasury of the company of not less than \$200,000.

The vote on this amendment was, ayes 4, (Hart not voting) noes, Gurnett and Edwards.

The original motion as amended was now voted on, ayes 4, (Hart not voting) noes, Gurnett and Edwards.

Can anyone imagine anything more infamous and iniquitous than this?

If there was a need for any service by Mr. Hart, if he could help the cause or gain anything for the stockholders it would be different; but the matter is in safe hands and needed no interposition by anyone. Mr. Wells is amply qualified to do all that was necessary, and the \$10,000 is but another subscription to the cause of corruption.

It is not enough that the unfortunate shareholders in this company have been shamefully defrauded by the last Board to

whom they entrusted their interests, but the new Board of directors flaunting the "Banner of Reform" under their very noses, start in on useless expenditure like this with a shamelessness which is only equalled by that of the unjailed criminal who was branded "thief" by the courts of justice. These people now commit an act which is scarcely surpassed by the reckless gang just found guilty of pilfering.

It is a painful coincidence that the people supposed to represent Mr. Flood in the present Hale & Norcross Board of Directors are Messer, Fish, Lyle and Wells—just four—and this donation of \$10,000 out of the treasury of the company was given by just four votes.

Let it be said to the credit of Messrs. Gurnett and Edwards that their votes were recorded against this iniquity.

Let this resolution be immediately rescinded, and let Mr. Hart, as a Director of the Hale & Norcross Company, entrusted with interests to protect, return at once to the company any sum or sums of money he may have received therefrom as a part of this \$10,000.

The stockholders will stand but little more of this. They appealed to the law to right their wrongs, as law-abiding citizens should do. They defeated the rascals who were stealing from them. They looked forward to relief from the wrongs, but apparently have not bettered themselves. It would look as if the Honorable Judge should have put the Hale & Norcross Company in the hands of the receiver instead of the judgment only, and then the shareholders would have been saved such outrages as this \$10,000 donation.

The Candidates.

The National Democratic Convention which is still in session as we go to press (on Thursday) has nominated Mr. Cleveland for the presidency and A. E. Stevenson for the vice-presidency. Within the coming fortnight the People's party and the Prohibitionists will name candidates, but they will make small figure in the campaign. The real fight, as the whole world knows, is between the Republicans and the Democrats—between Mr. Harrison and Mr. Cleveland.

There have been features of singular correspondence in the convention contests of the two parties. Both at Minneapolis and at Chicago there was a casting out of devils the like of which has not been seen before in the recent career of American politics. The Republicans dethroned the usurping leaders—Quay, Platt, Clarkson & Co.—and the Democrats tamed the Tammany tiger and gave Gorman, Brice et al. back seats. The contest in each convention was between the party and the bosses. It was the people against the politicians, and the people won.

If ever there was a time when the election of a Republican, as such, or of a Democrat, as such, would have menaced the integrity of the government, that time is now past. Those who read rightly the signs of the times and whose interest in politics rests solely upon regard for the welfare of the country, know that it is not Democratic or Republican success that is to be dreaded, but the success of bad Democrats or bad Republicans. The election of a Democrat under the spell and subject to the influence of the New York Tammany Society, and of such spoilers as Gorman of Maryland, Brice of Ohio, and it is with regret that we must include that brilliant man, Waterson of Kentucky, would, indeed, be a national misfortune; but no more a misfortune than would be the election of a Republican directed by such "practical" politicians as Platt of New York, Clarkson of Iowa, Quay of Pennsylvania and De Young of California. It is, indeed, a satisfactory and wholesome situation when each party can write a clean and honest name upon its banner, put its worst element to the rear, and go into battle upon questions of governmental policy concerning which honest and patriotic men may fairly differ.

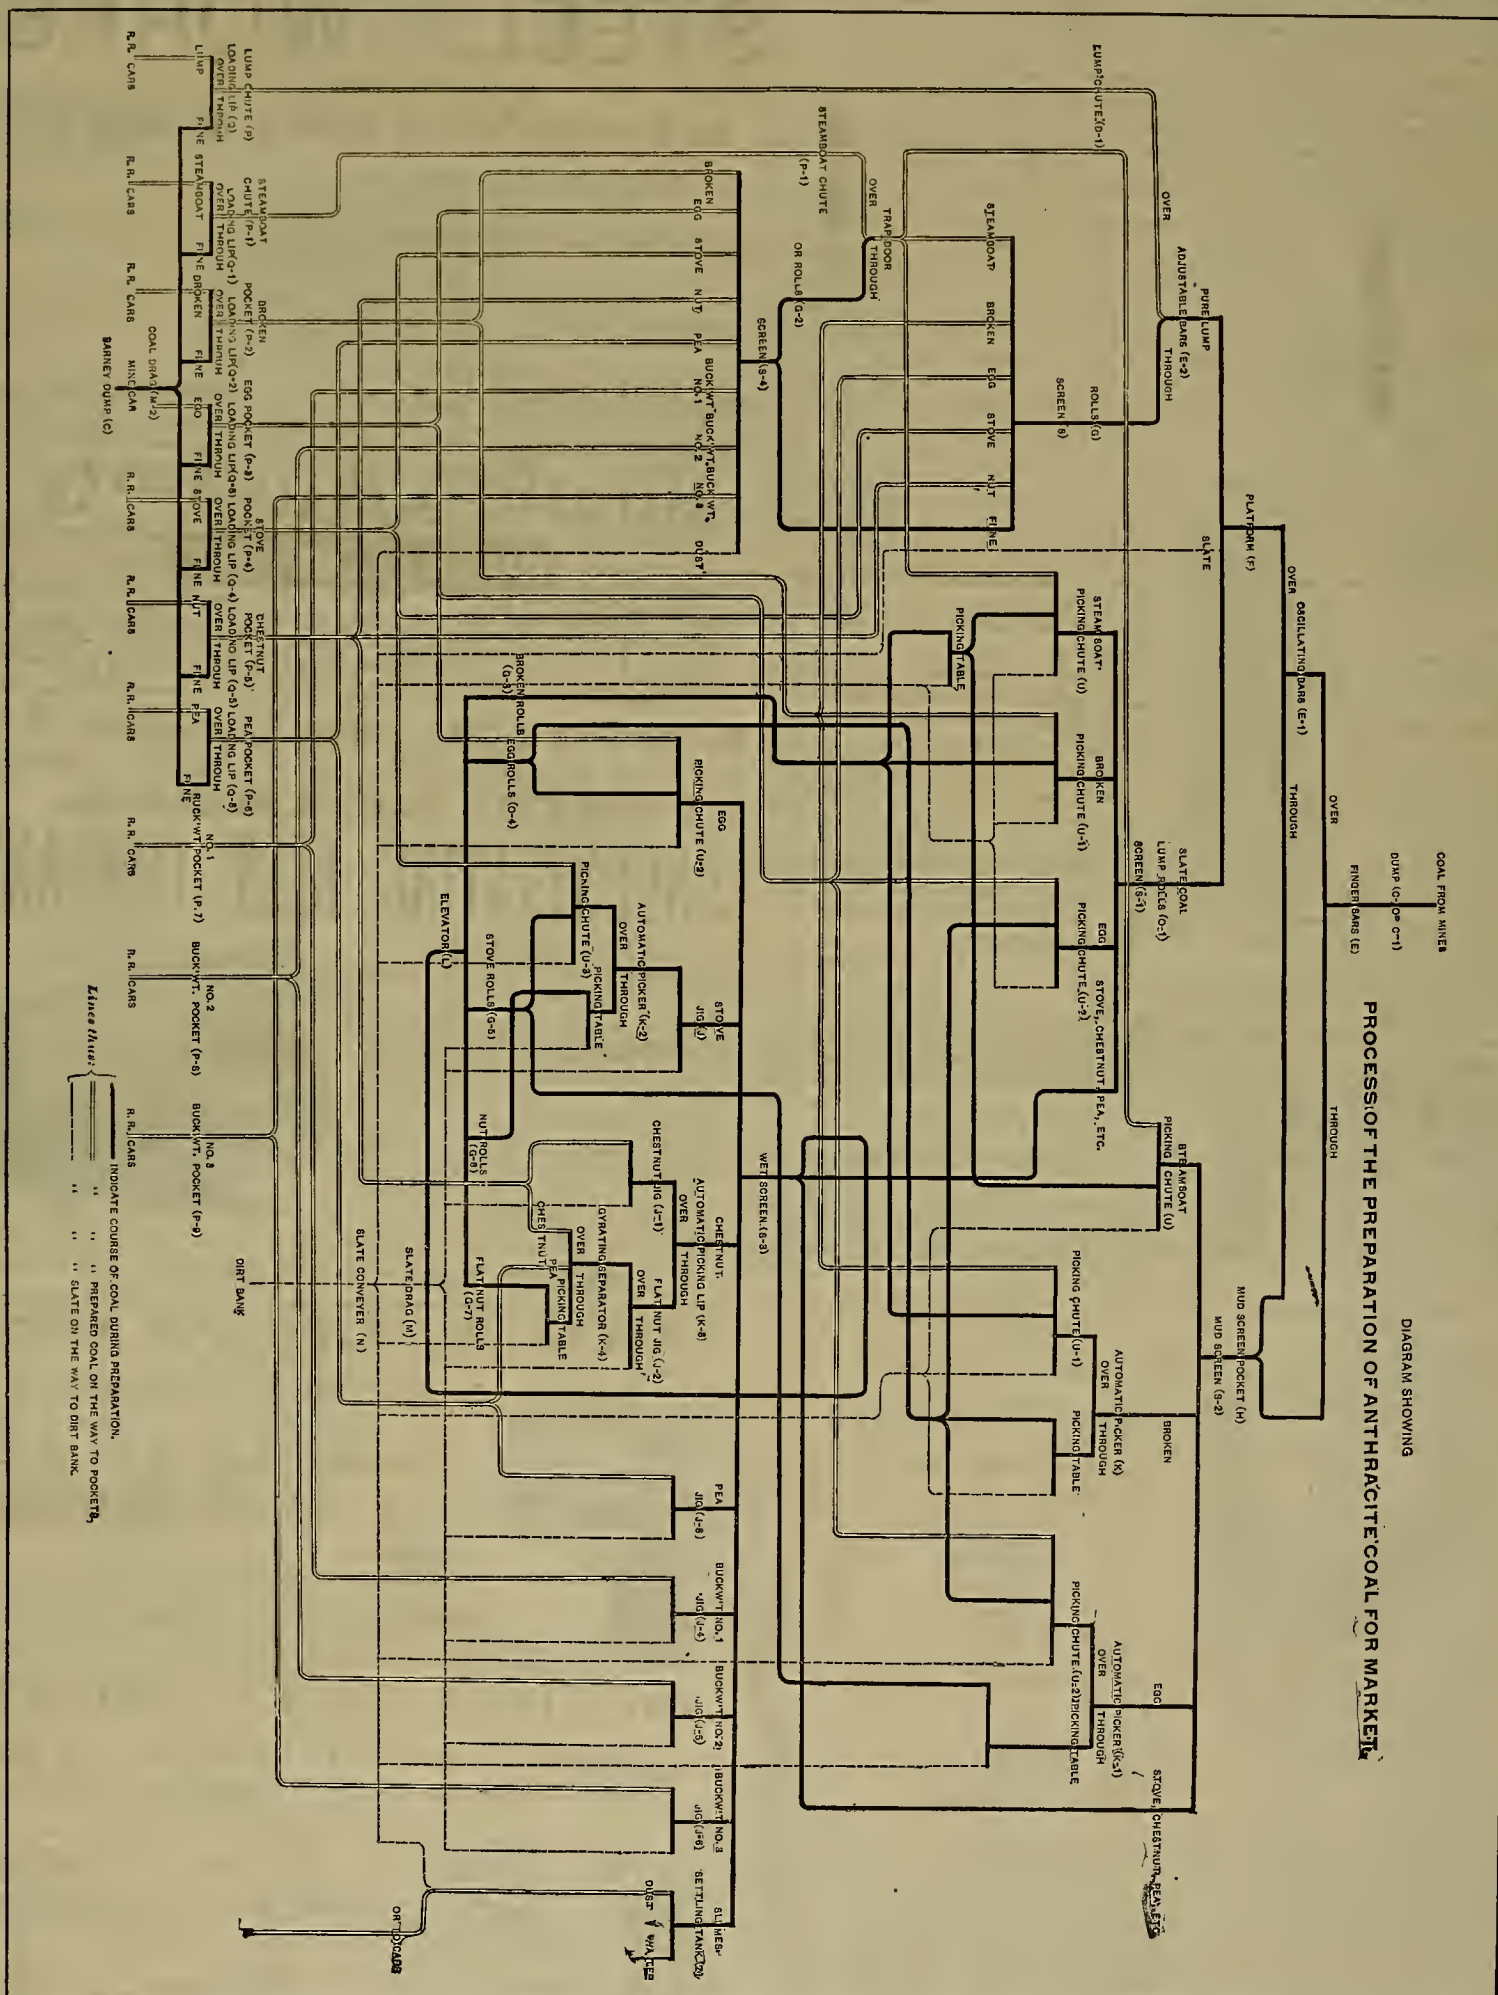

Preparing Coal for the Market.

Anthracite coal as it comes from the mines is not marketable. The "run of

as possible, so that between them a large amount of surface will remain exposed to the action of the air without checking the draught too much, or allowing enough air

therefore, that one of the most important points in preparation is to have a uniform sizing, and also to make as large a number of different sizes as can be produced with-

generally occur. The term "slate coal" designates lumps composed partly of coal and partly of slate, in which the pure coal occurs in such large masses that, by re-

mine" cannot, as in the case of bituminous coal, be sold. Anthracite, being very compact and practically free from volatile combustible matter, burns only at the surface, and it is, therefore, deemed important to have the lumps as nearly of a uniform size

to pass to cool the coal below the ignition point. In other words, if the pieces of coal of the size of a chestnut and smaller are mixed with lumps of the size of an egg, they fill the air passages and prevent a free draught. It has long been recognized,

out too great expense. It is also essential to remove all the dust, which is of little or no use at present, and depreciates the value of coal in the market.

Mixed with the pure coal, large amounts of slate, "slate coal" and "bony coal"

breaking, pieces of pure coal of marketable sizes can be obtained economically; and "bony coal" designates lumps in which the coal and slate are so interstratified that they cannot be separated economically by mechanical preparation, also coal in which the

impurities are present in such high percentages as to destroy or greatly diminish its market value. In other words, slate coal is coal from which, by breaking and preparation, a certain amount of pure coal can be obtained. Bony coal is coal which cannot be economically rendered more pure by mechanical preparation, although it may be used for certain purposes in its crude condition.

The problem is, to remove the impurities as completely as possible. Of course, when the slate occurs in separate pieces, it should be eliminated without further breaking. But the slate-coal must be broken into smaller pieces to separate the slaty portion from the coal. It is generally impossible to sell all the larger lumps which come from the mines, and machinery must be provided for breaking them up into such sizes as the market requires.

The coal coming from the mines should be divided into its various sizes, and the free slate in each size should be removed, before any breaking is done. This can be done either by hand labor or by mechanical means. In the first case the coal is passed along chutes, on the sides of which men and boys are placed, who pick out the slate, and in some cases the bony and slate-coal, and allow the pure coal to pass into the pockets. The mechanical elating of the coal depends upon one or more of three physical characteristics of the coal and slate: The difference in their specific gravity; the difference of the forms in which they break, and the difference of their angle of friction, or, in other words, the difference in the angle of a chute, lined with stone or iron, down which the coal or slate will slide without any increase of velocity. As a rule, slate will not slide down a chute which will carry coal.

In different numbers of the PRESS within the past few months the machines for sorting the coal have been described, these descriptions having been taken from a paper read before the American Institute of Mining Engineers by Eckley B. Coxe of Drifton, Pa., on "The Iron Breaker at Drifton, with a description of the machinery used for handling and preparing coal at the Oross Creek collieries." On this page is a diagram of the preparation, showing the progress of the coal through the breaker from the mine to the cars.

Geological Researches.

To Baron Ferdinand von Richthofen the London Geological Society has awarded this year the Wollaston medal, in recognition of the great merit of the researches carried on by him over a large part of the Old World and of the New.

Among the contributions made by him to the geology of the United States, is that of the Comstock lode and his remarkable generalizations as to the order of succession of the volcanic rocks and the nature of "massive eruptions" have attracted special attention.

The Baron spent somewhere about three years in a series of journeys through the vast Celestial Empire. The massive volumes and splendid atlas which contains his account of China, form one of the most important contributions ever made to geological literature.

The monograph on "Volcanic Rocks" written by Baron von Richthofen, was published by the California Academy of Sciences, the paper having originally been read before that society.

At the annual meeting of the Homestake Mining Co., the following directors were elected: Irwin O. Stump, J. B. Haggin, Lloyd Tevis, Louis T. Haggin and George J. Henry. Louis T. Haggin was elected president, J. B. Haggin treasurer and Irwin O. Stump secretary.

THE Omega mine and smelter, in the Arispe district, Sonora, has been sold by the Prefect of Police.

Professional Mine Directors.

The recent Hale & Norcross decision legally puts the directors of mining companies in the place they belong—simply agents of the stockholders. They have for years, however, when once in office, acted about as they pleased, without much reference to the wishes or interests of the stockholders, who are the real owners of the mines. This state of affairs has existed so long that many of those professional directors imagine certain of their "vested rights" have been interfered with by the decision of the courts. They are in a state of astonishment over having to refund money which they conspired unlawfully to take from the stockholders.

It is just such practices as were shown up in this case which have brought the mining stock business to the condition it now is, when the brokers can hardly pay office rent. The public long since had reason to become distrustful of the management of the companies. It was seen that there was very little chance for an "outsider" to make any money out of the legitimate mining operation. If he got nothing from increase in value of stock, there was no chance to get anything in any other way.

Gradually, people began to ignore mining stocks altogether and let the market severely alone. Finally the Mining Stock Association was formed and took steps to remedy some of the existing and well-known evils. A direct result of this determination was the successful suit against the Hale & Norcross directors for conspiring against the stockholders. The charges were proven, and the court decides that the directors shall refund \$1,000,000 unlawfully kept from the stockholders.

The findings in the decree have been signed by Judge Hebbard, and are in strict accordance with the opinion of the court, in which judgment was given for plaintiff. It is explicitly set forth that Hayward, Hobart and H. M. Levy conspired to defraud the stockholders of the corporation, and that they did defraud the stockholders to such an extent that the bullion yield of ores crushed at the Nevada mill amounted to only \$1,826,873, although it should have been \$2,616,491. All the circumstances of the conspiracy, as testified to on the trial, are stated in the findings. Each successive Board of directors of the Hale & Norcross Company, during the years that the conspiracy continued, are found to have been in collusion with Hayward, Hobart and Levy. The conclusions of law are to the effect that Fox is entitled to judgment for \$1,011,835. The decree contains the following: "The receiver shall have no power or authority to compromise any of the judgments or any part of any of the judgments herein given and made, nor to release any of the judgment debtors herein, except upon the order of this court to that end made. And it is further ordered, adjudged and decreed that W. T. Baggett and L. D. McKisick, attorneys for the plaintiff, are entitled to have and receive 25 per cent of all sums of money collected on the judgment or decree herein for their services, and that the receiver pay said sum to said W. T. Baggett and L. D. McKisick, whenever he shall collect the same."

The court fixed the bond of Receiver J. J. Groom at \$50,000.

PROF. S. W. BURNHAM, the senior astronomer at the Lick Observatory, has resigned his position and will return to Court work in Chicago, giving up astronomy altogether. He has especially distinguished himself as an observer of double stars, and his friends are surprised that he should retire from the field of science.

THE Gunright mine, near Phoenix, Arizona, will soon be opened again, this time by Denver and St. Louis capitalists. A 20-stamp mill is to be erected.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length and width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that could otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT. AUGUST 24, 1886.

CAPACITY. 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

Improvement in the Tulloch Concentrator.

James Tulloch of Angels, Calaveras Co., inventor of the Tulloch concentrator, which is manufactured by the Risdon Iron Works of this city, has just patented an improvement on the machine. In former patents issued to Mr. Tulloch, a traveling belt concentrator is shown with a mechanism by which the belt is advanced, and by which the table upon which it is carried is caused to rock from side to side. In these inventions the base of the belt-carrying frame or table is supported upon curved rockers, the effect of which is to carry the table from one side to the other in its oscillations. Under the present patent the frame is oscillated about a single supporting point, and consequently the belt dips downward alternately upon each side as it oscillates with a comparatively sharp movement, the arc of the circle upon which it moves depending upon the distance between the hinge or socket piece and the level of the belt. When supported upon rockers, as in the former patent, the belt is thrown from side to side, but without this sharp vertical motion, and the advantage in the present case is the more complete separation of the lighter from the heavier particles as they flow over the belt and the settling of the latter to the bottom. In order to prevent the material from flowing over the sides of the belt, it is passed over rollers, the central portions of which are cylindrical and the ends conical, the bases of the cones being outwardly and of larger diameter than the cylindrical portion. By these means the edges of the belt are always turned upwardly, thus forming a trough in which the material is caused to travel and prevented from passing off to either side of the belt. A thin and flexible belt may thus be used which, under ordinary conditions, would lie flat; but it is sufficiently upturned at the edges by the action of the rollers to give it the necessary trough shape and holding capacity. This belt will run very easily over the rollers without danger of breaking the edges.

The Mining Congress at Helena.

The Helena session of the National Mining Congress opens on July 12th. The Southern Pacific, in connection with other Western lines, has agreed to make a rate of one fare for the round trip to the mining congress, which is to meet at Helena, Mont., on July 12th. The tickets will be good for thirty days, and will be honored on the return trip over either the Ogden or Shasta route.

The Mayor of this city has appointed 21 delegates from San Francisco, and others will be appointed at large by the Governor. A number of the gentlemen selected have signified their intention of going, so that California will be more fully represented than at Denver last year.

Naturally the subject of silver will take up a large part of the time of the convention. Still, the matter of mineral lands on railroad grants will receive attention. The question of the illegal alienation of the mineral domain is important to the whole country, and each State and Territory has trouble on that score. The rights of agricultural claimants in some way seem to have become superior to those of the mineral claimant of late years. At any rate it is much easier to take up and patent agricultural than mineral land. All these matters will be acted on at the coming convention, at which all the mining States and Territories will be represented.

A MOVEMENT is on foot to hold a miners' convention some time in June in Grant's Pass, for the purpose of forming a local organization and cooperating as far as possible with the miners' association of California. J. T. Flynn is now in communication with officers of the last-named organization in San Francisco.—*Jacksonville (O.) Times*.

A New Camp in Arizona.

The oft repeated statement of the *Miner* that this county has never been fully prospected has again been verified by the discovery of the richest ledges of silver ore ever found in Arizona territory, or in fact on the Pacific coast.

The discoverers of this rich camp, says the *Mohave Miner*, are Judge Henry Schaefer, John Bennett and John L. Sullivan, of Gold Basin. The attention of these gentlemen was attracted to that place by an Indian, who exhibited some remarkably rich surface rock, and who for a consideration led the way to the mines. The new camp is fifty miles due north from Kingman, on the east side of the Sacramento valley, in the Cerbat range of mountains. The high range is mallapai or lava, while below in the low foothills the outcrop is micaceous granite; where the mines are found lava from the higher range covers the country for miles in the form of float and lava ash far into the valley. The camp is in a canyon facing the west, the ledges running directly east and west, following the general run of the canyon.

The original discoverers have located many of the best mines upon which considerable work is being done. The Schaefer Treasury, Grand Anny, Emma, Horn Silver, Occident and others belong to the discoverers. The three first named claims are on one vein and with a location made by W. B. Ridenour gives over a mile of locations on the one ledge, and traceable the entire distance on the surface until it reaches the valley on the west, where it is covered up by debris. On the east the ledge runs in under the lava mountain. Scattered over the surface of these claims is float rock broken from the ledges that will run thousands of dollars in silver. Tons of this rock can be shoveled up and shipped to the sampler. In the ledges streaks of solid yellow chloride and horn silver crops far above the surface. The Grand Anny shows a four-foot vein of ore, two feet of which will run fully \$1000 per ton, while the balance will mill over one hundred ounces per ton silver. The other ledges on this vein are fully as rich as the Grand Anny.

The Emma is situated on a knoll in the edge of the valley, and besides carrying hundreds of ounces of silver per ton runs over \$100 in gold.

Robert Patterson, Sol Rowe and Frank Robinson have a location named the Prince Albert, on the same hill on which is situated the Grand Anny, which shows up ore assaying \$3500. Chippings of a forty-five pound chunk of this ore runs fully \$6000 per ton. On the south side of the wash are the Horn Silver, Occident and other claims that show up wonderfully rich ore. The croppings of the ledges are black iron-cap, below which is the richest ore ever opened up in Arizona. Old-timers say the resemblance to the mines of Pioche, Nevada, is wonderful, although much richer.

There are at present thirty-five locations in the camp, but every day adds to the number, as people are flocking in by the hundreds and locating everything in sight. It is expected that in two months it will be one of the liveliest camps on the Pacific coast.

Water and wood are scarce, but steps are already being taken to pipe water in from springs six miles away, while in the valley cactus suitable for firewood grows in large quantities to a height of forty and fifty feet.

No mining strike in the past twenty years has caused such excitement in Mohave county as has this. Our miners were so used to hearing of rich strikes being made around them that they became indifferent and would not even go to see the claims although but a few miles away. But this last strike is not like the others. It has the bottom to it to make a camp greater than Leadville in its palmy days. On the surface of the ground is enough ore to make all the locators wealthy without putting a pick in the ground.

W. F. Grounds succeeded in getting a location on the principal ledge by a practical use of judgment. He found that two locations took in more surface ground than the customary limit of 1500 feet and by measuring off the claims secured nearly 300 feet of the best ground in the mine. He was immediately offered \$10,000 for the claim but refused the offer; as it is thought there is fully \$3000 worth of broken ore on the surface. Many shafts will be sunk in the valley in hopes of striking the large vein in a short time. The whole canyon is a net work of ledges and much litigation will result from location of cross ledges should the original locators not make locations of everything in sight.

The belt runs due west crossing the valley into the river range in Minnesota and

Weaver districts. A number of locations have been made in the same belt in the river range and rich ore taken from them. William Ridenour has a large chunk of ore at Hackberry from the new strike which is said to be the richest piece of ore ever seen in that town. Mr. Ridenour has been to nearly every new excitement on the Pacific Coast and is considered the best judge of a mine in the county, and his report on the new find is that nothing like it has been seen in years. John K. Mackenzie, L. J. Lassell, Judge Murphy and many other old miners say they have never seen so large a quantity of rich mineral on the surface before; that the surface indications of Pioche or Tombstone were as nothing compared with this great discovery. The new district runs east into Gold Basin, and covers four miles in width by a mile and a half in length. Inside this limit it is a perfect network of ledges.

The best way to get to the camp is from Kingman by way of Chloride, Quail Springs and Mountain Springs; a distance of fifty miles. From Hackberry over a good road to Gold Basin; thence to Cold Springs and over the mountain a distance of eight miles brings you to the mines—a total distance of sixty-five miles.

In Hackberry all is excitement and nearly the whole population has been out to the mines. Jas. Rosborough and Mrs. Davis and Mr. Philips have secured some good locations. People from the Park are appropriating every conveyance that can be used to carry them to the camp. Gold Basin is wholly deserted and other towns will be in the same fix as soon as the news reaches them.

The strike is not a fake as the mines are easily accessible. No snow to hide them away from sight, nor burning waste of sand to cross to reach them. A day's ride from Kingman or Hackberry will take you to the mines.

In thirty days water will be flowing into the camp from the surrounding springs and several thousand men will be working in the camp.

COMPRESSED AIR.—German engineers are of the opinion that quite a success has been achieved by the recent establishment at Offenbach of a system of pipes for the transmission of power by compressed air, the laying down of the pipes having been commenced about a year ago, and the work being consummated in the face of many difficulties. The total length of pipes thus laid amounted to 7760 yards, of which 1702 consisted of pipe one foot in diameter, 1710 yards of eight inches diameter, and 4347 yards of four inches diameter. The pipes were laid about one and one-half feet below the footpath, the connections of the pipes being made by means of India rubber, according to the method pursued for similar work in Paris, and valves are provided for shutting off the air from separate lengths of pipe. On the initial trial of the system, made by the engineering authorities of the town and by the Boiler Inspection Association, it appeared that there was a loss amounting to 0.11 of an atmosphere in seven and one-half hours, that is 0.39 of a cubic metre per hour kilometre, a loss equalling 13 per cent. on the daily output, the power transmitted being, on an average, 500 horsepower—a very favorable showing.—*Scientific Machinist*.

ELECTRICITY IN MINING.—The Leavenworth (Kansas) Coal Company is busy placing in its mine electric machinery, whereby the great labor and expense of coal mining will be simplified, and the price of coal will naturally be lowered. This device digs under and removes the earth from the vein of coal, and then tears the coal down, leaving for men only the work of placing the coal in the cars. The vein of coal in the Leavenworth mine is 22 inches in thickness, and all the coal mined in that vicinity has heretofore been done by the miners in a laying-down position, picking the coal from above. The machinery now being placed in position will do the work of 40 miners, while its cost will be practically insignificant.—*Iron Manufacturer*.

THE machinery of the new electrical ore reduction works at Albuquerque, N. M., has been ordered and the plant will be in operation this summer. It is claimed that refractory ores can be successfully treated by this process, and experiments have been made with ore from that county, which are said to have been highly satisfactory. Ex-Governor Stover, who is one of the members of the company which will erect the works, is very enthusiastic, and is certain that the venture will be a success. If it will do what is claimed for it, a large number of mines in this territory which produce low grade refractory ores can be worked profitably.

MOTIVE POWER HERCULES Gas and Gasoline ENGINES

Have fewer parts, and are therefore less likely to get out of order than any other gas or gasoline engines now built. Just light the burner, turn the wheel, and it runs all day.

MAKES NO SMELL OR DIRT.

No double or false explosions, so frequent with the unreliable spark.

For Simplicity It Beats the World.

It Oils itself Automatically.

No Batteries or Electric Spark.

It runs with a Cheaper Grade of Gasoline than any other Engine.

COLUMBIA, CAL., FEB. 15, 1891.

MESSES. PALMER & REY, San Francisco, Cal.
DEAR SIR: Yours of the 8th to hand. In reply will state that the one-horse power Gasoline Engine I got from you has been running every day, for the past three weeks, and has given entire satisfaction. It is placed in a tunnel full 300 feet from the surface, and is holding ore from 100 feet below that. It does all you claimed for it, and is the best and cheapest power that can be had in or about a mine. A number of mining men in this locality have viewed the machine in operation, and they all pronounce it a perfect success.

Yours truly,

F. L. McPHERSON.

The Folsom Dam.

(Continued from page 455.)

containing a reserve of more than 13,000,000 cubic yards of water—a body of water of the most important magnitude, which is constantly available, in addition to the ordinary daily flow of the river, and all held at at such an elevation that it can irrigate the tillable lands of Sacramento county, besides having a head of 175 feet above Sacramento City (distant about 20 miles). It will thus be easily practicable to supply Sacramento with an unlimited quantity of pure American river water, drawn above all sources of contamination, and having a pressure greatly in excess of the present supply, which, being pumped from the Sacramento river, at a point below the junction of the American river, necessarily carries all the sewer discharge and other contaminations of both rivers.

The plans for the utilization of this water supply, for all purposes other than "power" purposes, will be carried into effect by the Sacramento County Water Co., a corporation which will be formed specifically for the purpose of receiving from the Folsom Water Power Co. its entire water supplies, franchises and privileges, after the "power" shall have been developed, and supplying with water, for both private and municipal uses, almost the entire area of Sacramento county. The map accompanying this shows the area which can be irrigated. Each square equals one township. On both systems of canals, reservoirs will be built to hold surplus water.

Similar "reservoir" facilities, and on even much greater scale, exist on the upper courses of the American river, above the dam of the Folsom Water Power Co., so that it is only a question of time, and the judicious expenditure of capital, to augment the supply of irrigation water just as fast as it may be called for. Undoubtedly, it would take many years to elaborate every detail of this vast system, and it will consequently be the policy of the company to first construct works which will supply the lands most in need of irrigation, and which will the most readily yield profits thereon. When the whole works are completed, some 400,000 acres of land may be brought under irrigation through the construction of the dams and canals.

INDISCREET MR. CROSSMAN.—The *Call* of Wednesday says: James H. Crossman, an aged mining man who recently arrived from Riverside, entered Hinckley alley Monday afternoon in search of N. Garcia, a restaurant-keeper whom he had known in Los Angeles. Garcia had moved, and while Crossman was wandering through the Latin quarter he fell in with two young men who agreed to show him Garcia's place of business. The three men drank considerably, and after Crossman came under "the influence" his companions took him to a room in a house on Broadway and took from his pockets \$220 in greenbacks and checks and a certificate of deposit representing \$8000 in a Riverside bank. The robbery was reported to the police yesterday, and Officers Anthony and Lindsay arrested Charles Flint, a petty thief, and William Watson, a Barbary Coast hoodlum. They were charged with grand larceny. About \$40 of the stolen money was found in their possession. The thieves had quarreled over a division of the spoils and separated. When arrested each attempted to shift the crime upon the other. Both were under the influence of liquor.

MR. JOHN BEST, of Lancaster, Pa., has just been appointed agent of the Lidgerwood Manufacturing Company, New York, manufacturers of hoisting engines. His territory will be Lancaster and vicinity. Mr. Best is well known as an engineer of prominence in his native city, and will doubtless meet with gratifying success in his efforts on behalf of the Lidgerwood "Standard" Hoisting Engines.

The soliciting committee has raised \$50,000 of the \$80,000 required for the location of an iron plant in San Diego. It is believed the entire amount required will be secured this week. English capital is backing the enterprise.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, June 23, 1892.

Business the past week was active, with a large increase in the output of goods sent out. There was a decided increase in the demand from agricultural districts and seacoast ports. The advance made in harvest work under favorable weather conditions, has inspired more confidence and San Francisco merchants do not hesitate in extending credit to merchants in the farming districts. Even at present low prices for ruling wheat and barley a fair profit is left farmers who employ the latest and best improved methods in farming. The expenses have been greatly reduced by using labor-saving machines so that prices now received for grain nets a profit, which, a few years ago, would have netted a loss. Miniog, deep gravel and river, is being vigorously pushed in all directions. With the rehabilitation of hydraulic mining and honest management of the Comstock mines, gigantic strides will be made by the industry. The local money market is easy, more so in this month than ever before in the month of June. Heretofore banks and corporations called in money in this month to disburse for interest and dividends in the month of July. This year there does not appear to be any necessity for such a course owing to a glut of money. The disbursements in next month will put several million dollars in circulation which will add still more to the depressed money market, unless it should be offset by a now unlooked for demand for money either for speculation or legitimate business purposes. At the East the same conditions obtain in the money markets which were noted last week. The foreign commerce of New York is steadily mounding in larger figures. The total imports for May were \$44,648,000, and excepting those for May last year are the largest since the settlement of the port. For 11 months the aggregate is \$490,643,000, as against \$492,380,000 for the corresponding months last year. The shipments from New York for May were \$36,267,335, showing a gain as compared with the same month of last year of \$4,418,265 in produce and merchandise, and a decrease of \$25,485,775 in specie, as the exports for May of last year included over \$30,000,000 in the precious metals. For 11 months the exports are \$433,076,899, against \$402,340,735 for the same time last year. The balance of trade to the end of April was upward of \$200,000,000 in our favor. The only dark cloud which looms up is the renewed fight between ironmasters and their employees in Pennsylvania and Ohio. In both localities the manufacturers propose a reduction of wages, and a prolonged contest is not improbable.

In referring to the present trouble, *Iron Age* says that "the all-absorbing topic is the prospect of a strike in the Western Rolling Mills on July 1st. The Amalgamated Association has practically adopted last year's scale, while the manufacturers demand a considerable reduction, the Pittsburgh makers being in conference to-day. In the steel trade interest centers on the action of the Carnegie Steel Co., which has formulated rates of wages designed to readjust matters on the basis of the great increase in tonnage brought about by improvements in machinery."

SILVER.—As was to have been expected, the market sagged off as soon as the mints had secured the required 4,500,000 ounces for June. These purchases, combined with the export movement, have made the market very sensitive and given to silver more speculative importance. Quite a number of speculators buy silver on the decline which invariably sets in each month after the mint has bought the required 4,500,000 ounces, and sell when the mint is in the market the succeeding month. Each month finds prices a shade higher. The two national parties have resolved on silver, and it now remains for Congress to decide which is more favorable to their pet views. It is claimed that the present Congress will not take any action on the silver question, but let it pass, to be taken up by the next Congress, when there is no election to be influenced by its action on the metal.

MEXICAN DOLLARS.—The market is dull and heavy at 70¢/71 cts.

QUICKSILVER.—Receipts the past week aggregate 431 flasks, and the exports by sea to Mexico 110 flasks. The market is steady, with a fair demand at current quotations.

BORAX.—There was received the past week 3100 sacks from Cheato, Oregon. Owing to the threatened labor strikes at the East, and also the usual dull midsummer trade, the market is slow and barely steady.

LIME.—Receipts the past week aggregate 3569 bbls. The shipments to Hawaii are quite free. The market is irregular at \$1.25 to \$1.50 per bbl.

PIG LEAD.—The market is reported weak at quotations. Eastern mail advices report more pressure to realize, and, as consumers were indifferent, concessions followed. At the decline, the market is barely steady.

PIG TIN.—The market does not appear quite so strong. The bull movement at the East appears to have seen its best, with the short July interests filling both at home and abroad. Unless the price of silver is advanced, it is not at all likely that tin will go as high as it did about ten days ago. Consumers at the East are holding off.

PIG IRON.—In our market there is absolutely nothing of interest to report. The stock is going into consumption. A continued dropping in the Eastern markets causes consumers to buy sparingly. New York mail advices report that market as follows: "Bessemer pig is weaker, and has sold at lower prices because the consumption during July will be heavily curtailed. Steel billets have advanced to \$22.75 to \$23 for June delivery, the advance being partly due to the purchasing of billets by concerns who expect a strike. By sympathy, the Eastern billet market has been strengthened. Consumers in the East are even now discriminating in favor of Eastern mills, which will not be affected by the struggle. In the Eastern pig iron market some Southern furnaces have made low prices, and the cutting in standard Northern brands threatens to lead to sharp retaliatory measures on the part of a leading producer. The charcoal pig iron market has been stirred up by the heavy buying of Eastern malleable iron manufacturers."

COPPER.—The markets at home and abroad are quiet. The looked-for improvement has not materialized, but it is still confidently looked for. At New York more Lake Ingot is offering, and to sell, it is doubtful if over \$11.70 per 100 lbs. could be secured. Castings brands are dull and heavy at the East.

COAL.—Imports the past week aggregate as follows: Tacoma, 4700 tons; Seattle, 3600; Coos Bay, 500; Departure Bay, 5647; Newcastle, N. S. W., 1100; total, 13,547 tons. The market appears to be shaping into a better position for sellers. Stocks have decreased, while the imports are light and the quantity on the way is not large. On the Atlantic seaboard the coal combine put up the price and contemplates another advance on July 1st. The consumption of steam in this State will soon begin to enlarge.

Eastern Metal Markets.

New York, June 23.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	89 1/2	11 7/8	4 1/2	2 1/2	26 1/2
Friday.....	89 1/2	11 7/8	4 1/2	2 1/2	21 1/2
Saturday.....	89 1/2	11 7/8	4 1/2	2 1/2	21 1/2
Sunday.....	89 1/2	11 7/8	4 1/2	2 1/2	21 1/2
Tuesday.....	89 1/2	11 7/8	4 1/2	2 1/2	21 1/2
Wednesday.....	89 1/2	11 7/8	4 1/2	2 1/2	21 1/2

Pig iron looks badly owing to July short sellers filling. Lead is steady at last week's decline. Copper has ruled dull and barely steady. Quicksilver is firm. Borax is dull but steady.

Mining Share Market.

SAN FRANCISCO, June 23, 1892.

Mining shares appeared to have taken on a new lease of life on last Monday, for they began to strengthen under the lead of Belcher. The shares of the Middle and Gold Hill group of mines advanced for two days, but the shares of the north end group were dull and heavy, with Ophir sold down by the bears. The short lived activity is referred to by the bear contingent "as a dying kick of the share market." The action of the share market justifies their belief that it is the throes of death, for never in the history of the Comstock mines was dealing in mining shares so light. Freeding the 1888 deal, and as for that of all deals, the shares sold at low prices but there was active trading and brokers counted their daily commissions by the dollars; but now while shares are low trading is very light, and brokers' daily commissions do not average enough to pay office expenses. It is all outgo and no income. Not only are they running behind in office expenses but such stock exchanges as to levy assessments to pay current expenses. This looks very much as if brokers are reaping their just reward. They planted and watered a tree from whose branch clubs have been taken to knock out the little financial hounds, they boast of being possessed of, or, in other words, they gave to the tools of the mill rings their proxies, and now they are to continue idle, looking at this. This course they were induced to by "tips," money paid, or other equally as disgraceful and dishonest methods.

The only way brokers can redeem the market, for many of them appear past redemption themselves, is to unite and demand of the rings that they turn over the mills to the miners. This is the only possible way by which the public can be induced to trade. It is dry rot now, and by proper fumigation and application of tonic, the business can be made healthy and brought up to a higher standard, where dealing in mining shares will partake more of the legitimate and not of gambling at a thieves' proposition. The cry should be, turn the mills over to the miners, and the rings will not do it, and their free will, they force them by law, through suits, both civil and criminal. It is openly asserted by well-informed mining men that nearly every mine on the lode can be made to pay dividends under honest management and the mines owning the mills.

The manager of owner of the cyanide process for Nevada announces that he can reduce Comstock ore and return 90 percent of its assay value. J. H. Kinkadee, a well-known Comstock mining man has invented a new process by which low grade Comstock ore can be worked at the small expense of two dollars a ton, against six dollars a ton, the average rate now charged. Mr. Kinkadee also claims that by his process a higher percentage of bullion can be returned than is now returned by the mills. Working tests have been made of the above two processes with very satisfactory results, fully substantiating what is claimed for them. In view of this it becomes more urgent that the mines own the mills so as to have introduced the latest and best improved methods for reducing Comstock ore. It is now claimed that the California Pan Mill was razed because the percentage of bullion returned was so high that very little was left for the "little joker" to keep for the private benefit of mill owners. If this is true, and persons considered thoroughly reliable, say it is, then it is only reasonable to conclude that as long as the mills

are not owned by the mines, so long will no improved methods be introduced for the benefit of mine shareholders.

Shares in the Gold Hill group were slightly higher. The rings are sedulously having reported an improvement in one or two of the mines in that group, but under the present system of mining and milling on the Comstock, it would take ore bearing veins nearly pure gold to get the managers to have shareholders receive the smallest fraction of the bullion that is not confiscated for private purposes. It is claimed that next month the inside will start in on a contest for the control of Savage, but whether they will succeed in getting outsiders to buy remains to be seen. While Comstock mines are all right, it is said in the way in which bullion disappears and assessments loom up, that is all wrong to every person except members of the rings. Under these circumstances it is the height of nonsense to give favorable news from the mines.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING JUNE 14, 1892.

- 476,778.—SACK-FILLING AND SEWING MACHINE—Bibb & Timewell, Spokane, Wash.
 477,107.—TICKET PUNCH—W. C. Downing, S. F.
 477,172.—CAR BRAKE—J. W. Fisher, Palouse, Wash.
 477,110.—PAINT—W. B. Frederick, S. F.
 477,111.—CONCENTRATOR—Geo. Gates, Jackson, Cal.
 477,114.—BUMPER FOR VEHICLE SPRINGS—Milton Hall, S. F.
 477,013.—WASHING MACHINE—C. F. Lane, Tolare, Cal.
 477,129.—DEBRICK—G. L. Langhton, Reno, Nev.
 477,136.—HEADER STEER WHEEL BRAKE—D. E. Mentzel, Spangle, Wash.
 476,807.—HOTEL DESK—J. D. D. Mortimer, Stockton, Cal.
 477,147.—FLOOR OR ROOF FOR BUILDINGS—G. W. Parker, S. F.
 477,148.—LIGHT TRANSMITTING FLOOR—G. W. Parker, S. F.
 477,075.—SAFETY CAR—Wm. Skyrme, S. F.
 476,935.—ELECTRIC RAILWAY—C. P. Tatrow, Spokane, Wash.
 476,907.—BASE BAR FOR VIOLINS, ETC.—J. H. Tibbitts, San Diego, Cal.

The following brief list by telegraph, for June 22, will appear more complete on receipt of mail advices:

California—Milton A. Wheaton, S. F., can-heading machine; George H. Tietur, S. F., sign-etching machine; George H. Mareh, S. F., feed rolls; Armand R. Kluizer, S. F., table; Levi M. Kellogg, S. F., safety attachment for elevators; George F. and H. N. Gray, S. F., concrete mixer; George Grisel and F. Severio, S. F., machine for wrapping block matches; David Gutermaite, Petaluma, wash rest; Ivanpah, Petaluma, design; Julius A. Bidwell, Petaluma, pin; John A. Barker, Pasadena, head rest; John McCoy, Pasadena, pocket perfume case; Hector McKinnon, Eureka, bag lock; Thomas T. Scott and J. J. Shealer, Eureka, sawdust burning and air blast apparatus; Charles T. Tarpenning, Fresno, and L. B. Sherwood, Turlock, means for transmitting power; Washburn—John McKinnon, Colfax, clothes drier; George Biehn, Tacoma, window shade fixtures; A. Hughes, Spokane, rein holder; Oregon—Joseph Beel, Troutdale, feedwater heater; Rob Roy Parrish, Portland, furniture cast; Nevada—James McFarland, Virginia City, faucet.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail for telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CONCENTRATOR.—George Gates, Jackson, Amador Co. No. 477,111. Dated June 14, 1892. This is an improvement on the former invention patented by the same inventor Sept. 2, 1890. Its object is to provide a better distribution of the pulp between the supply sluices and the separating tables.

BUMPER FOR VEHICLE SPRINGS.—Milton Hall, S. F. No. 477,114. Date June 14, 1892. This consists of a semicircular and hollow elastic pad or block having extensions formed at each end and in combination therewith of a case adapted to inclose the lower portion and the extensions and means for securing the same.

DERICK.—Geo. L. Langhton, Reno, Nev. No. 477,129. Dated June 14, 1892. This derick is one of the class used for stacking hay. It consists in certain novel construction of the mast, arms and operating ropes so as to make a simple and effective portable derick.

TICKET PUNCH.—Wm. C. Downing, S. F. No. 477,075. Dated June 14, 1892. The object of this invention is to provide a punch with convenient mechanical operating mechanism and a means for providing a check and register of the fares taken by the preservation of marked clippings from the tickets which are punched.

SAFETY CAR.—Wm. Skyrme, S. F. Dated June 14, 1892. The inventor calls this "an accident-escape attachment for railway cars." It consists of a series of door openings formed in the floors or roofs of the cars—doors which said openings are normally closed and means by which the doors are automatically opened whenever an accident occurs by which the car is upset so as to leave free egress to the passengers. This provides an easy means of escape where the ordinary doors or windows of the coach are not available.

PAINT COMPOUND.—Wm. B. Frederick, S. F., assignor to the Atmospheric Paint Compound Co. This is a preparation which is especially valuable for the purpose of mixing with ordinary paints. The effect of the use of the compound is to cause the paint to spread more easily and cover a broader surface. It also causes the paint to last longer.

DIVIDEND NOTICE.

The German Savings and Loan Society, 526 California Street.

FOR THE HALF YEAR ENDING JUNE 30, 1892, A dividend has been declared at the rate of five and one-tenth (5 1/10) per cent. per annum on Term Deposits, and four and one-quarter (4 1/4) per cent. per annum on Ordinary Deposits, payable on and after FRIDAY, July 1, 1892. GEO. TOURNEY, Secretary.

RISDON IRON WORKS PAYS THE FREIGHT.

Common Sense New Steel Whim

All Complete for \$125, Freight Prepaid to any Railroad Station in California.

No cog wheels or clutches to break. Ninety per cent of this whim is wrought iron and steel, and will spring or bend instead of breaking, and besides, can be repaired at any blacksmith shop should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes and waiting a week for repairs. It can be packed anywhere a jack can go, the heaviest piece weighing 800 pounds. Total weight, 800 pounds.

It is just the whim to open up mines in isolated camps where steam power and experienced men are hard to get. With one horse 25 tons can be hoisted 300 feet on each shift. It is just as safe and reliable as an engine. Over 1800 in use, some running eight years without one dollar's expense. We make two, four and eight-horse power whims for heavy mining, also derrick whims, and ever thing pertaining to horse power hoisting.

Buy a good whim and put more money into underground work is the way to open up a mine and make it pay.

For circulars and cuts giving full information, write to

RISDON IRON WORKS,
BEALE AND HOWARD STS., SAN FRANCISCO.

Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, Virginia Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Trustees, held on the seventh (7th) day of June, 1892, an assessment (No. 69) of Twenty-five (25) Cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twelfth (12th) day of July, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 4th day of August, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Trustees,
ALFRED K. DURBROW, Secretary.

Office—Room No. 69 Nevada Block, No. 309 Montgomery Street, San Francisco, California.

THE BUTTE KING MINING COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Butte County, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1892, an assessment (No. 4) of five cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, 723 Market St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 11th day of July, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 2d day of August, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
W. C. LEWIS, Secretary.

Office, 723 Market St., San Francisco, Cal.

TERKOFF G. M. AND M. COMPANY. LOCATION of principal place of business, San Francisco, Cal. Location of works, Butte County, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the 31st day of May, 1892, an assessment (No. 8) of one cent per share was levied upon the Capital Stock of the Corporation, payable immediately in U. S. Gold Coin, to the Secretary, at the office of the Company, 808 Pine St., San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 6th day of July, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Friday, the 29th day of July, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors,
W. J. GURNETT, Secretary.

Office, 808 Pine St., San Francisco, Cal.

The Explorers' and Assayers Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$8.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral value are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formula as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

DEWEY

ENGRAVING COMPANY
Make the best of Photo-Engraving Relief Printing Plates, Fine Zincographs, Wood Engravings, Society and Business Seals, Negatives, Blue Prints, Photo-Lithographic Transfers, Magic Lantern Slides and other Scientific Photographing, and nearly all kinds of Engravings. Our Photo-facsimile or

HALF-TONE ENGRAVINGS

By our New Secret Processes, are unsurpassed by any others. Prices Uniformly Reasonable. Send for Samples and Estimates. 220 Market St., San Francisco.

—AND—
CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.

Stamp Co.

Books on ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Refining; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 litho. pages, with illustrations, well bound in cloth; 1892. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 155 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose publication is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$2. Sold by DEWEY PUBLISHING CO., 220 Market St., San Francisco.

Malthine M'f'g Co.

FACTORY:

Cor. Jefferson & First Sts., Oakland, Cal.

MANUFACTURERS OF

ACID, ALKALINE AND WATER-PROOF PAINTS,

Superior to anything of the kind in the market for

IRON, WOOD AND TIN.

Unequaled for Submerged Timbers. Red and Brown Paints for Roofs, Warehouses, Stables, Fences, Etc., mixed Ready for Use. Also Sheathing Paper, Portable California Mastic Roofing, the Best in the Market for

RANCH AND CITY.

AND UNEQUALED FOR

Teredo-Proof Pile Covering.

This Company also Manufactures a Malthine Compound for

RENDERING BOOTS AND SHOES WATERPROOF.

The same is a superior article for Preserving Harness rendering it impervious to Moisture and keeping it always pliable and soft.

Send to Factory, Jefferson and First Streets, Oakland, for Samples and Prices.

EMBRACING IN ITS
VARIATIONS OF
CONSTRUCTION
AND APPLICATION

THE PELTON
SYSTEM OF
POWER

THE PELTON WATER WHEEL.

The most distinctively new and important development relating to hydraulic power that has been made in the last half century. Adapted to all conditions and every variety of service where a head of 20 feet or more can be obtained.

OVER 2500 IN USE, AGGREGATING NEARLY 300,000 H. P. Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 to 2000 or more feet. Much better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC POWER TRANSMISSION. The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water power required, and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, varying from the fraction of 1 up to 100-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above. Deliveries made from San Francisco or New York, as may afford the most favorable freight rates. The great success that has attended the introduction and operation of the Pelton Water Wheel has led to many imitations and some infringements of the various patents of this company. Intending purchasers are hereby warned that all such infringements will be vigorously prosecuted, and that the users of wheels so infringing, as well as the manufacturers, will be held equally responsible.

THE GATES ORE AND ROCK BREAKER.

Unlimited in Capacity; Unequaled in efficiency. UPWARD OF 3000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without additional expense. Best and only Crusher adapted to Mcadam Road Work. Send for Circular.

THE PELTON WATER WHEEL CO., General Western Agents.

NOTICE TO GOLD MINERS!

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO.

No. 132 Market Street. San Francisco, Cal.

SAN JACINTO ESTATE, LIMITED,
 Office of General Manager,
 P. O. Address, South Riverside, San Bernardino Co., Cal.
 CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodhull" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
 I am, my Dear Sirs, Yours faithfully,
 S. HARRIS, Manager.
